1. Safety

1.1 Safety Icons

Pay attention to the following icons and their meanings. Failure to follow these guidelines can result in equipment damage or personal injury.

 WARNING	• Not following these instructions may lead to minor injuries.
 CAUTION	• Not following these instructions may lead to major injuries.
 DANGER	• Not following these instructions may lead to serious injuries or death.

1.2 Safety Guide

- **Do not fly at night or in bad weather like rain or thunderstorm. It can cause erratic operation or loss of control.**
- **Do not use the product when the visibility is limited.**
- **Do not use the product on rainy or snowy days. Should any type of moisture (water or snow) enter any component of the system, erratic operation and loss of control may occur.**
- **Interference could cause loss of control. To ensure the safety of you and others, do not operate in the following places:**
 - Near any site where other radio control activity may occur.
 - Near high voltage power lines or communication broadcasting antennas.
 - Near water with passenger boats nearby.
 - Near high voltage wires or communication/broadcast antennas.
- **Do not use this product if you are tired, uncomfortable or when using substances that may impair your ability to use the product safely.**
- **The 2.4GHz frequency band requires line of sight from the transmitter to receiver at all times. Avoid large obstacles that could block or interfere with the signal.**
- **In order to ensure good signal quality, do not hold the transmitters antenna during use.**
- **Parts of the model, such as motors or ESC's may remain hot for a period of time after use and can cause severe burns.**

- **Improper use of this product may lead to serious injury or death to the user and others. To ensure the safety of yourself and others read and follow the instructions set out in the user manual.**
- **To avoid damage to the model, make sure that the product and model are installed correctly before use.**
- **Always power off the receiver before the transmitter. Powering off the receiver before the transmitter could lead to loss of control.**
- **Before use make sure that all the servos and motors are moving in the correct direction.**
- **Make sure to remain within range to prevent loss of control.**

2. Battery Safety Instructions

⚠ Danger

- 🚫 This product's battery is rechargeable and non-removable. Do not remove the battery from the product.
- 🚫 Do not expose the battery to liquids.
 - Do not use a damp battery. Keep your hands dry during use and do not leave batteries in areas with lots of moisture.
- 🚫 Do not solder, repair, modify or disassemble the battery.
- 🚫 Do not charge the battery in direct sunlight, in a hot car or near anything hot such as cookers etc.
- 🚫 Do not use near flammable liquids or gasses.

⚠ WARNING

- 🚫 Do not Tap the charger or battery during charging.
 - May cause burns
- ❗ Keep the battery away from any heat source if it is leaking or causing strange smells.
 - May catch fire or explode.
- 🚫 Do not store the battery in dusty or humid environments.
 - Remove dust from the power connector before plugging in.

🚫 Do not charge batteries that show any evidence of damage, aging, leakage or exposure to liquids.

🚫 Do not Tap the positive and negative terminals of the battery together.

🚫 Do not throw the battery into a fire.

🚫 Do not charge without ventilation.

❗ Charge Transmitter Battery before use.

■ If there is not enough quantity of electricity during the flight, it will lead to a airplane crash.

🚫 Do not throw or impact the battery.

■ May cause fire or an explosion.

❗ Put some tape on the battery's terminals before recycling.

■ If the short circuit causes fire, heat, rupture, etc.

🚫 Do not charge the battery when exposed to extreme heat or cold.

■ May lead to a drop in battery performance. To ensure maximum performance always charge the battery within the temperature range of 10°C ~30°C .

3. Product Description

PL18 is an 18-channel air transmitter with 2.4GHz AFHDS 3 (third-generation automatic frequency hopping digital system). And there is a variety of built-in models that you can set as your desired. It adapts fixed-wing aircraft, helicopters, gliders, multicopters, robots, boats or cars.

3.1 System Features

AFHDS 3 (third-generation automatic frequency hopping digital system) is a newly developed digital wireless system with independent intellectual property rights by FLYSKY. It is compatible with one-way and two-way real-time data packet transmission and transparent data stream transmission. In other words, this system has advantages of both AFHDS 2A and WS2A wireless system. It equips with a brand-new 2.4G chip, stable and reliable connection, good real-time performance, and supports various configurations. Bring you the optimal configuration for multi-scenario application performance.

Compatible with Unidirectional/Bidirectional Real-time Data Transmission	The system supports one-way and two-way connections. When the transmitter is working in one-way transmission way, the receiver can receive data from the transmitter. When the transmitter is working in two-way transmission way. The receiver can receive data from the transmitter and the transmitter can also receive data from the receiver, as well as the information cross from the temperature and speed sensor modules.
Data Transparent Transmission	The independent data transparent transmission module is built into RF system, which can realize data transmission via transmitter and transparent transmission. It can be used for data transmission of flight control.
Intelligent RF configuration	To set the parameters which affect RF transmission distance, speed and anti-interference, such as numbers of channels, resolution, bandwidth and receiver sensitivity. The system can be set according to different application requirements to obtain the most suitable performance.
Multi-channel Frequency Hopping	This system's bandwidth ranges from 2.402GHz to 2.480GHz. Set intelligent RF configurations according to your required, it can avoid or reduce the interference from other transmitters with the same frequency via different configurations, different time of powering on the transmitter, various patterns to the hopping frequency and various using frequency spots.
Unique ID Recognition System	Each transmitter and receiver has its own unique ID. Once the transmitter and receiver have been bound, they will save the each other's ID and only connect with each other. When the system is working, if the IDs are matched with each other, then the connection will be connected, otherwise, there is no connection between transmitter and receiver. This unique ID recognition system resists the interference so as to make the system stabler and more reliable.
Low Power Consumption	It is built using highly sensitive, low power consumption components. And it works in the way of interval data transmission to improve transmitting efficiency effectively and extend the working time of the battery distinctly, while it consumes as little as one tenth the power of a standard FM system.

[9]	Left Stick	[19]	SWG Position Switch	[29]	VRC Knob
[10]	TR3 Trim	[20]	VRE Knob	[30]	Power Switch

Front View- Reset Button

The reset button is accessible at the lower part of the transmitter as shown above. You need to tear apart the grip to find it. To press it by using a long thin tool, such as a smaller screwdriver.

In case of the transmitter can not be powered off by pressing the two **Power Switches**, please reset the transmitter with the **Reset** button.

• After resetting, the settings which set before resetting may be invalid.

3.2.1 Transmitter Antenna

PL18 transmitter has two built-in antennas. When the transmitter starts to work, the antennas automatically operate, without additional operations.

- **To ensure a good signal, do not cover or block the antenna.**

3.2.2 Stick/Knob/Switch/Button

The PL18 has 2 sticks (Left stick and right stick), 6 switches (SWB, SWD, SWE, SWF, SWG and SWH) , 5 knobs (VRA to VRE) and 2 buttons (SWA and SWC), and 8 trim buttons (TR1 toTR8).

Sticks: Output different value when it is in different position, they can output continuous signal. And they can be used as function controls, as well as switches to turn on/off the function.

Knobs: The knobs can implement the same function as sticks. Part of them can be used as trim controls.

Switches: There are two-position switches and three-position switches. Different value is corresponding to different position. They can be used as function controls, as well as switches to turn on/off the function.

Buttons: The buttons can implement the same function as switches.

Trim buttons: Output different value when toggling. They can be used as function controls, refer to **7.8 Trim** for detailed.

3.2.3 LED Status

Note: This function is available for 1.0.65 or later.

The status LED is used to indicate the power supply status of the transmitter and its working status. The LED lights up in three status: gradual light, flashing, and solid on.

- The LED is off, indicating that the transmitter is powered off.
- When the screen is off , and the LED is in gradual light status:
 1. The LED colour changes alternatively among cyan, magenta, and yellow. It indicates that the RF is enabled and the receiver is not connected or bound in one-way.
 2. The LED colour is yellow, indicating that the RF is disabled and the receiver is not connected.
 3. The LED colour changes alternatively among red, green and blue. It indicates that the RF is enabled and the receiver is connected.
- When the screen is on, and the LED is solid on:
 1. The LED colour is blue, indicating that the RF is enabled and the receiver is not connected or bound in one-way.
 2. The LED colour is yellow, indicating that the RF is disabled and the receiver is not connected.
 3. The LED colour is green, indicating that the RF is enabled and the receiver is connected successfully.
- The LED is flashing red, indicating that there is an alarm.
- The LED is flashing green rapidly, indicating that the binding is in progress.
- The LED is cyan, indicating the transmitter is powering on.

Note: When the binding and an alarm are triggered at the same time, the binding takes priority. That is, the LED will be flashing green fast.

3.2.4 Stick Mode

This system supports four stick modes. As for aircraft models, from channel 1 to channel 4, by default, these four channels are assigned to aileron, elevator, throttle, and rudder. There are four modes of the sticks in order to meet the different requirements. You can select suitable mode among **Mode1**, **Mode2**, **Mode3** and **Mode4**. The mode is highlighted in green indicating it is the currently selected mode, and the default mode is **Mode 2**. You can select suitable mode as your desired. Then you need to adjust the gimbals as needed to match the mode. Follow the steps below.

Setup:

Enter the Model Setup interface via **Home1 > Basic > Model**, then tap the function box next to **Stick** to enter the stick mode. Select the mode as your desired. Then click **◀** to return.

Note: It is also can be set in updating wizard interface after the transmitter firmware is updated. The factory preset mode for the stick can be set in this interface. Only transmitter firmware version 1.0.55 or later has this function.

3.2.5 Gimbal Assembly Adjustment

By adjusting the screws on the back of the transmitter, gimbal stick can be either self-centering or non-self-centering, as well as changing stick tension/friction.

Setup:

Available options:

① . ⑤	To change the gimbal sticks self-centering or not.	② . ⑥	To change vertical tension of the gimbal sticks.
③ . ⑦	To change horizontal tension of the gimbal sticks.	④ . ⑧	To change the vertical friction of the gimbal sticks

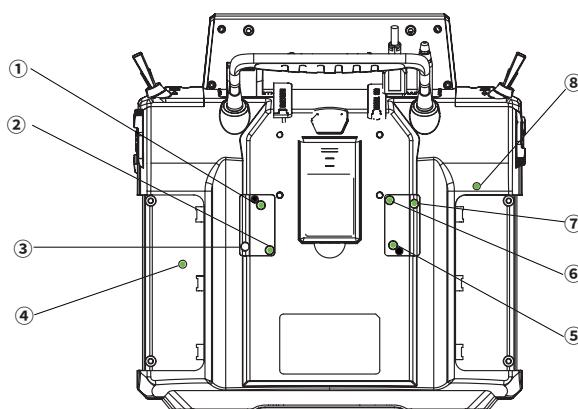

- | | |
|------------------|---|
| ⚠ CAUTION | <ul style="list-style-type: none"> When the counterclockwise adjustment is made, the entire range of movement of the screw is about 6 circles(the tightest to the loosest). Be cautious not to adjust it too far or the screw will fall out. |
|------------------|---|

Take right gimbal as an example:

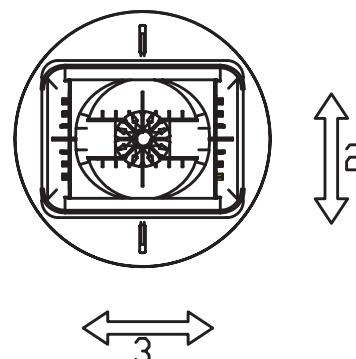

Non-self-centering to Self-centering: 1. Use a Phillips screwdriver to adjust the screw ① counterclockwise until the gimbal changes to self-centering.
2. Adjust screw ④ counterclockwise to adjust the friction.
3. If you need to adjust the strength of the centering, adjust screw ③ or ② to change the strength of self-centering, and to strengthen the strength clockwise, otherwise it's to reduce.

Self-centering to Non-self-centering:

1. Use a Phillips screwdriver to adjust the screw ① clockwise until it is tightened so that the gimbal stick changes to non-self-centering.
2. Adjust the screw ④ clockwise to strengthen or reduce the frictional.
3. If you need to adjust the strength of the self-centering, adjust screw ③ to change the strength of self-centering, and to strengthen the strength clockwise, otherwise it's to reduce.

Back View of Gimbal Assembly

View of Stick's Swing

3.2.6 Power Switches

To prevent false triggering, there are two switches on the lower part of the transmitter. Turn on or turn off the transmitter when both switches are pressed at the same time.

3.2.7 Charging Mode

PL18 can be charged in two ways:

Plug the micro USB cable into the **Micro USB** port of the transmitter for charging.

Use the wireless charging dock to charge it.

Notes:

1. Charge it within the safe range (4h@5V*2A//7h@5V*2A wireless charging). Overcharging may lead to battery damage.
2. To prolong the service life of the battery, properly discharge if you want to store it for a long time (that is, not fully charged). In addition, you need to charge it regularly to prevent damage due to non-operation for long term. and charge it regularly to prevent over-discharging damage during storage; It is recommended that the lithium battery be charged to 40-50% of its capacity for preservation. For example, it is recommended that the storage voltage of lithium battery is 3.85V in case of preservation. You need to check the voltage value of the battery every 3~6 months.
3. The transmitter will shut down automatically along with a voice reminder if the voltage is lower than 3.4V.
4. When the battery of the transmitter is in over discharge status and the transmitter is powered off, and at this time if the transmitter is to be charged, it will be in a slow charging mode. The battery symbol will show a yellow lightning icon when the transmitter is charging while powering on.

- Please use the micro USB cable shipped with this transmitter. Improper use may cause damage to the battery and affect its service life.

4. Pre-operation Setup

Follow the instructions and guidelines in this chapter before use.

4.1 Receiver And Servo Installation

Make sure that the receiver is mounted in an appropriate location within the model, to ensure a stable signal, maximum range and to mitigate external interference, follow these guidelines:

Pay attention to the following when installing the receiver:

1. Make sure the receiver is not installed near ESCs or other sources of electrical noise.
2. Keep the receivers antenna away from conductive materials such as carbon or metal. To ensure normal function make sure there is a gap of at least 1cm between the antenna and the conductive material.

CAUTION

- To prevent damage do not power on the receiver during installation.

5. Operation Guidelines

Follow these guidelines to use the transmitter and the receiver.

5.1 Powering On

Note: This function has been updated in version 1.0.73 and later.

Note: If the power-on wizard interface appears when the transmitter is turned on for the first time after updating the firmware, follow the prompts to set [Stick Mode], [Stick Calibration] and [Update RF], and then click [Start] and the system will continue to start.

Follow the steps below to power on:

1. Check to make sure the receiver is installed correctly and that the receiver is powered off.
2. Press and hold both Power Switches until the screen lights up, and the transmitter LED is cyan;
3. Follow the pop-up prompts accordingly to power on the transmitter.
 - Whether to turn on the Transmit function. If RF is not required for this power-up, the transmit function can be switched off.
 - Whether the switch is in a safe position. (A red background on a control indicates that the position needs to be adjusted.) Check the position of the control according to the prompts and move it to the correct position.
 - Whether the current model is set the failsafe. If you want to disable the failsafe setting reminder upon power-on, tap Never notify or disable Startup reminder failsafe is not set via General or turn off Startup reminder model failsafe is not set in the Failsafe function.

Note: If the RF module is disabled while the transmitter is turning on, to enable it, then the receiver can be connected.

 CAUTION	<ul style="list-style-type: none"> • The system is now active, be cautious to not cause damage or personal injury.
 CAUTION	<ul style="list-style-type: none"> • If SWA/SWB/SWC/SWD/SWE/SWF/SWG/SWH switches are not at their high positions and the throttle stick is not at its low position when the transmitter is powered on. A prompt will appear to remind you to put these switches and throttle stick to their proper positions. It is recommended to follow the reminder to put them to their proper positions. The transmitter will launch. If you click Go to launch the transmitter without putting them to their proper positions, this may lead to danger.

5.2 Binding

Note: Adds C-Fast 10ch function item and the function of identifying compatible receivers of non-FlySky authorized third party brands for version 1.0.55 or later.

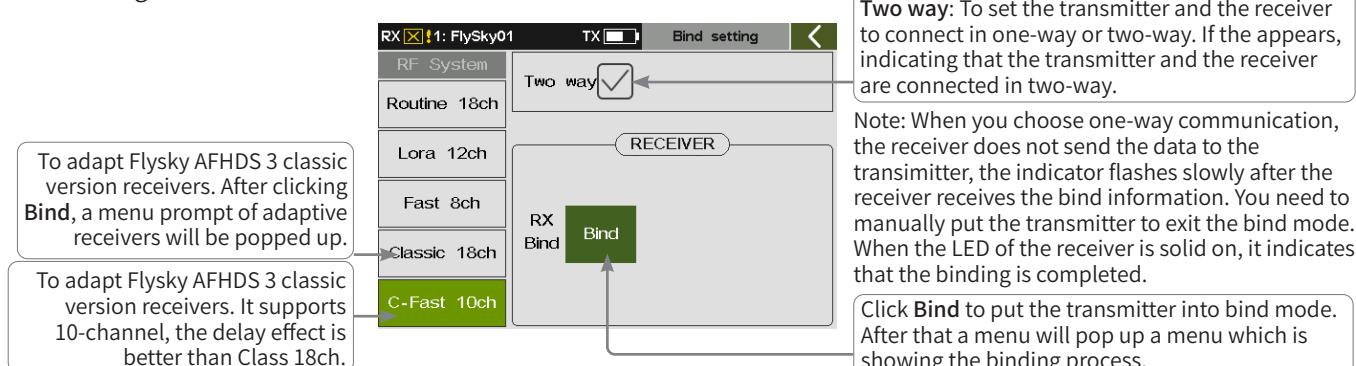

The transmitter and the receiver have been pre-bound at the factory. If you need to rebind or bind a new receiver follow the steps below. The Flysky AFHDS 3 receivers are consisted by classic version receivers and enhanced version receivers. The bind method is slightly different between these two versions.

Note: Flysky AFHDS 3 classic version receiver models: FTr10/FGr4/FGr4s/FGr4p/FTr4/FTr16S. Other Flysky AFHDS 3 receivers are enhanced version receivers.

 WARNING	<ul style="list-style-type: none"> • Power off the servo while the transmitter and the receiver is binding. Otherwise, it may lead to danger. • After the binding process is completed, power off the receiver, then power on the receiver and check to make sure that the transmitter and the receiver have bound successfully.
---	--

To enter the Bind setting interface via Home1 > Basic function > RX setting.

The binding interface of classic version receiver:

微信公众号

Bilibili

Website

Facebook

The binding interface of enhanced version receiver:

Note: Routine 18ch, Lora 12ch and Fast 8ch can only be bound with enhanced receivers.

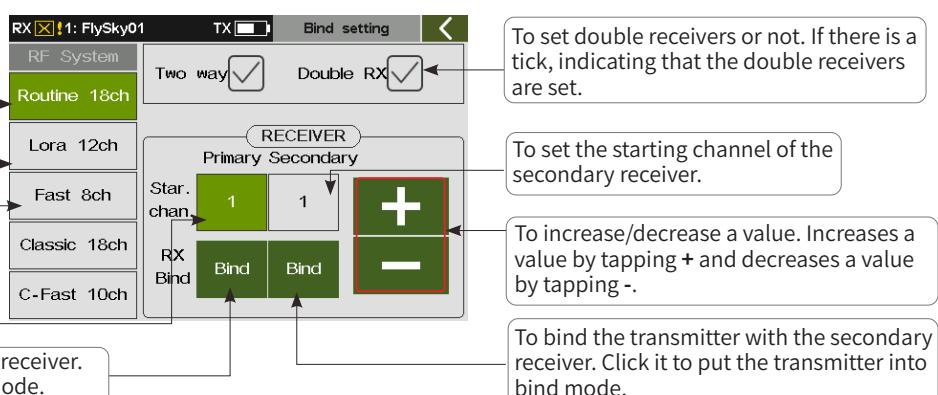

Provides 18 channels with moderate communication distance.

Provides 12 channels with super anti-interference and moderate communication distance.

Provides 8 channels, fast communication within short distance.

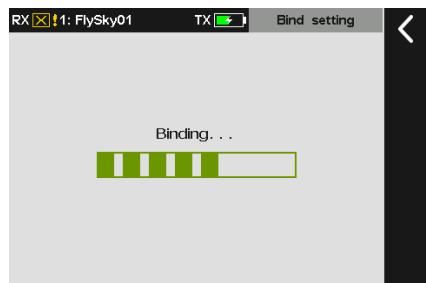

To set the starting channel of the primary receiver.

To bind the transmitter with the primary receiver. Click it to put the transmitter into bind mode.

Function Settings:

- Power on the transmitter, enter the bind setting interface via **Home 1> Basic > RX setting**.
- Tap **Bind setting** and enter the binding setting interface. Then set some items, such as selecting suitable RF System, choosing two way or not, or setting the starting channel. Afterwards, click **Bind** to put the transmitter into bind mode.
- Put the receiver into bind mode (Refer to the manual of the receiver for details.)
- The LED of the receiver stops flashing and is solid on, indicating that the binding process is finished.
- Check to make sure the transmitter and receiver are working normally, repeat steps 1 to 3 (binding process) if any problems arise.

Notes:

- The binding method may vary with different receiver, For specific binding methods, please visit the official website of FLYSKY for receiver instruction or other relevant information.
- After the transmitter and receiver establish stable two-way communication, a pop-up window will appear when the receiver is identified as a compatible receiver of a non-FlySky authorized thirdparty brand. Meanwhile, the radio frequency will be interrupted.

5.3 Pre-operation Checks

Always perform the following steps before each operating:

- Inspect the entire system to make sure that everything is working as expected.
- Perform a range test as described in the **16.6 Range Test** section of the user manual.

	DANGER	• Do not use the model if there are any abnormal behaviors during the test.
	DANGER	• Do not exceed the maximum rated range during use.
	CAUTION	• Interference from other transmitting devices may reduce signal quality.

5.4 Powering Off

Follow these steps to power off the system:

- Power off the receiver.
- Press and hold both **Power Switches** on the transmitter, then the screen dims with the prompt "Shut down...please waiting for!", the screen powers off, indicating the transmitter is turned off.

	DANGER	• To avoid any risk of loosing control of the model, always power off the receiver before powering off the transmitter.
--	---------------	---

6. Main Interface

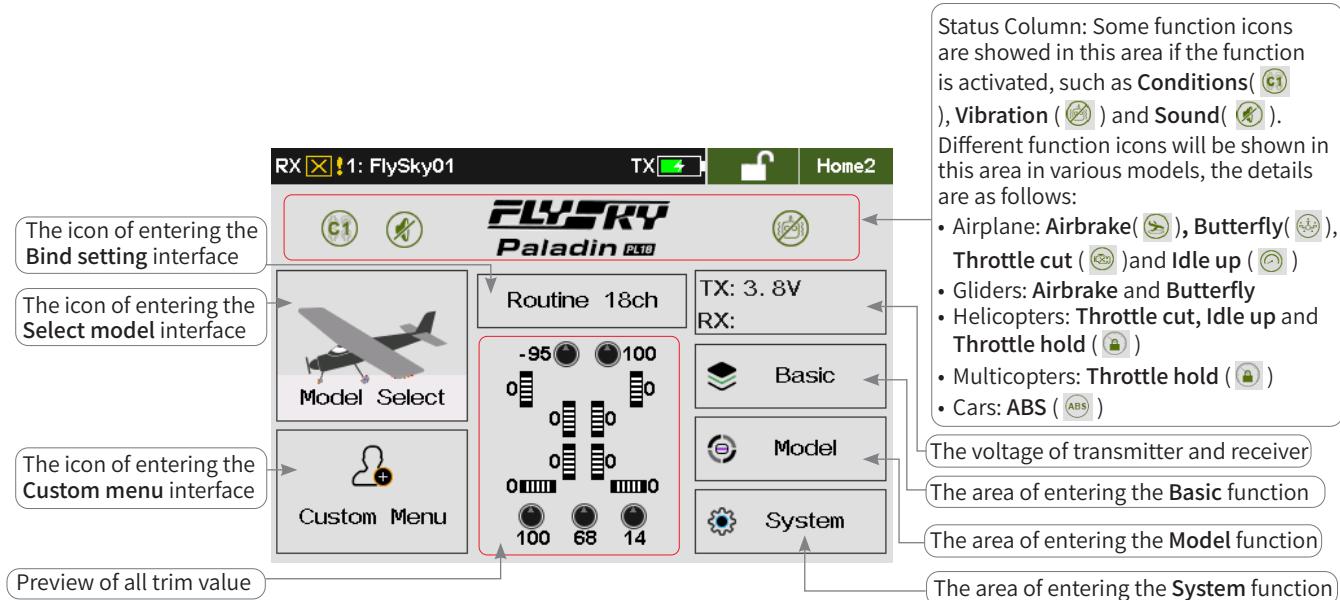

This is an introduction about the transmitter's main interface.

6.1 Main Interface Overview

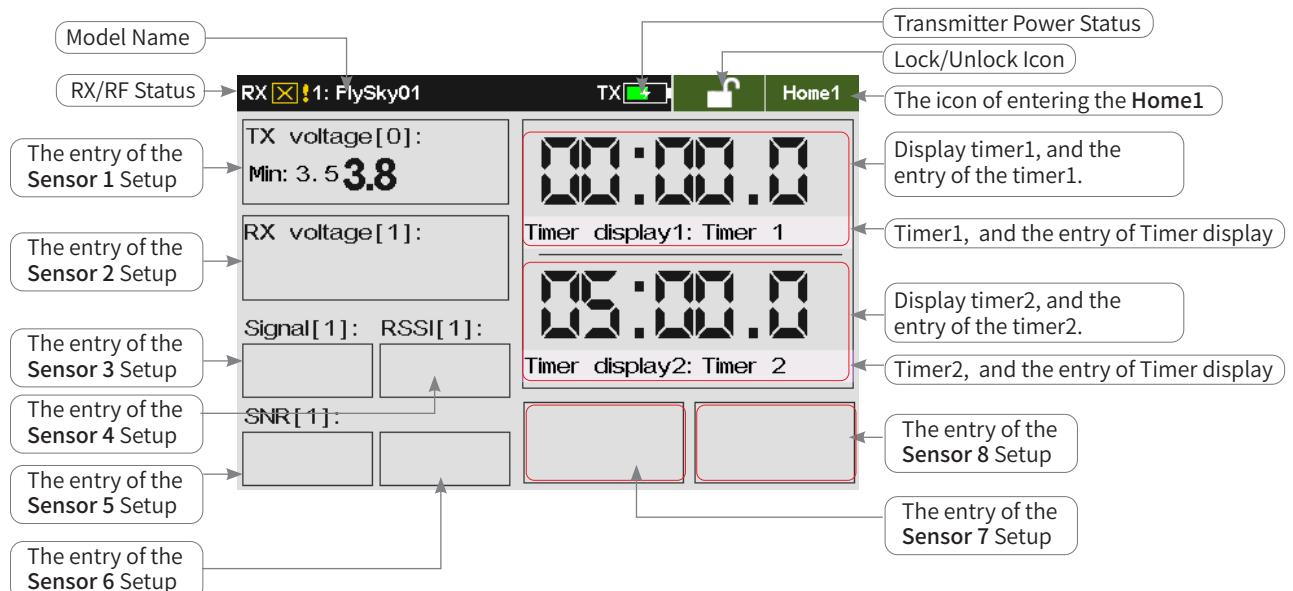

Note: Adjust the menu layout, it is available for version 1.0.65 or later.

The main interface displays information related to the model such as sensor information and function status.

7. Basic Settings

Note: Adjust the menu layout, it is available for version 1.0.65 or later.

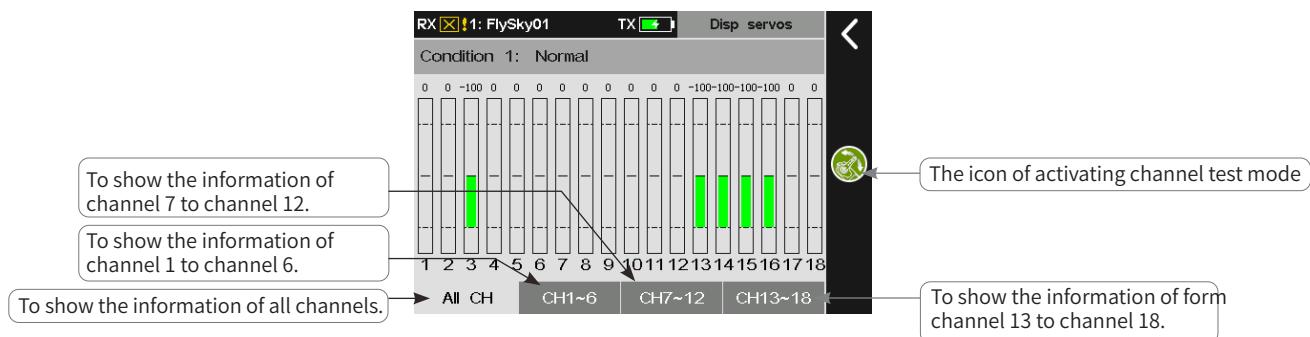

This chapter introduces the settings of basic function mainly in default condition. You can access **Basic** function interface via **Home1 > Basic**.

7.1 Display Servos

Note: To show the information of all channels in a page, it is available for version 1.0.65 or later.

To display the real time output value of each individual channel. Servos can also be tested.

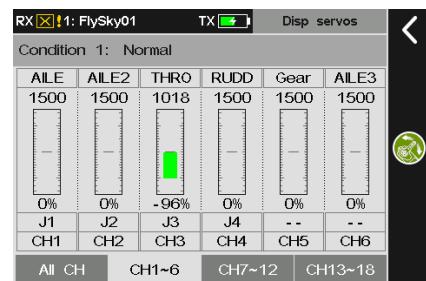

7.1.1 Display Servos

To display the real-time output value of each individual channel.

Setup:

1. Acess **Display servos**.
2. Toggle or press the **Switch/Knob** assigned to the channel.
3. Monitor the output value of the channel in **Display servos** interface.
4. Click **⬅** to return to the previous interface.

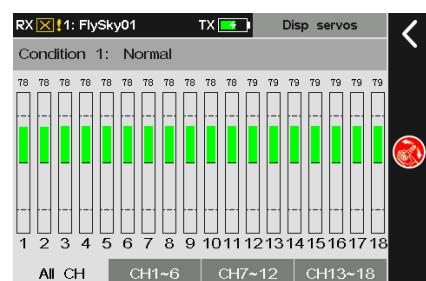

7.1.2 Channel Test

The servo can be tested. When it is turned on, the servos of all channels will move slowly and repeatedly. Please be caution when the function is activated.

Setup:

1. Tap **⌚** to activate channel test mode. A prompt interface appears, then press **Yes** to start. When test mode is active all channels will slowly move through their entire range of motion.
2. Click **⬅** to return to the previous interface.

- **Do not activate this function when the transmitter is connected to the model engine or the engine is started.**

7.2 Model Select

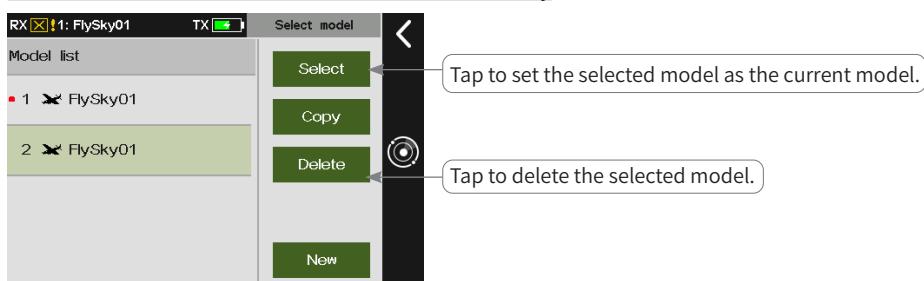

Note: This function is available for version 1.0.65 or later.

This function is used to create a new model by Copy or New function, delete all models except the current model, or search the receiver corresponding to the model. The settings of the models vary for the different models. This function provides opportunities that one transmitter can adapt varieties of real models.

The interface for the model which is operating currently

The interface for the model which is not in use currently

7.2.1 Automatical Searching For The Receiver

To search for the power-on receiver which has bound with the transmitter already. After tap , the system will sequentially switch models to synchronize the receiver under this model.

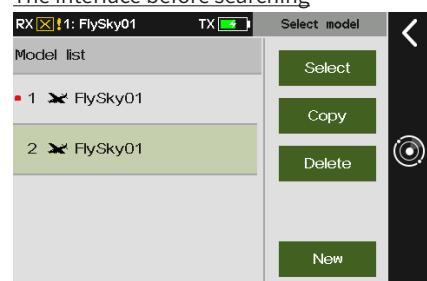

Setup:

1. Power on the receiver.
2. Enter **Select model** interface.
3. Tap at the right of the interface to search for the receiver automatically, and a prompt window comes along with it, press Exit to stop searching.
4. After the searching process is completed, the red dot will move to the model which is corresponding to the receiver. And the transmitter has connected the receiver normally.

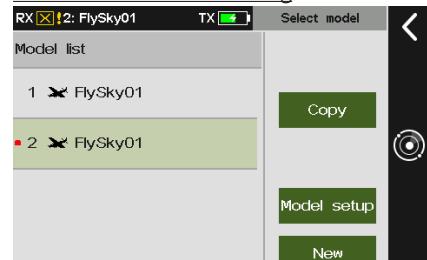

Notes:

1. The RF module needs to be enabled.
2. Ensure that the receiver is bound with one model only, and duplicate models may not be searched.

The interface before searching

The interface after searching

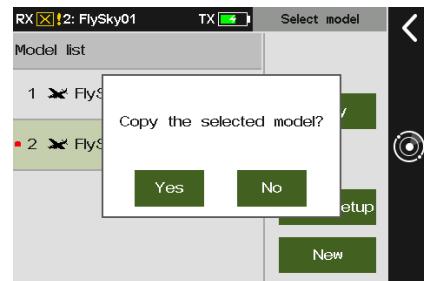

7.2.2 Copying A Model

To copy the data of the selected model to another model.

When a new model is to set up, you can use this function to copy existing model data and then modify different parts without repeating the settings. It is very convenient.

Setup:

1. Enter Select model interface.
2. Tap the model that you want to copy.
3. Tap **Copy** and click **Yes** on the pop-up interface to complete a copying model. Afterwards, click **◀** to return to the previous interface.

Note: After copying model is completed, the new model is selected by default which is the last one in the list.

7.2.3 Creating A New Model

To create a new model.

Setup:

1. Enter Select model interface.
2. Tap **New** and click **Yes** on the pop-up interface to create a new model. Afterwards, click **◀** to return to the previous interface.

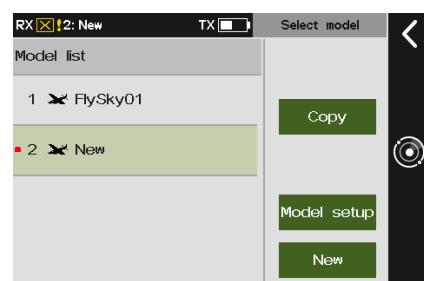

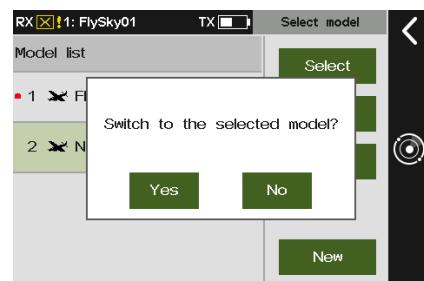

Note: After copying model is completed, the new model is selected by default, it is the last one in the list.

7.2.4 Selecting A Model

To set the selected model as the model currently in use.

Setup:

1. Enter Select model interface.
2. Tap the model that you want to set.
3. Tap **Select** and click **Yes** on the pop-up interface to complete. the red dot will move to the selected model. Afterwards, click **◀** to return to the previous interface.

Note: Model data can be inherited through FlyskyAssistant (FlyskyAssistant firmware Ver. 3.0 and later)

微信公众号

Bilibili

Website

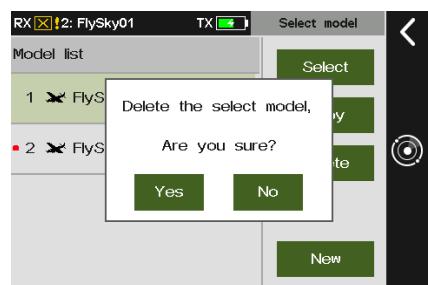

Facebook

7.2.5 Deleting A Model

To remove a model from the memory of the transmitter.

Setup:

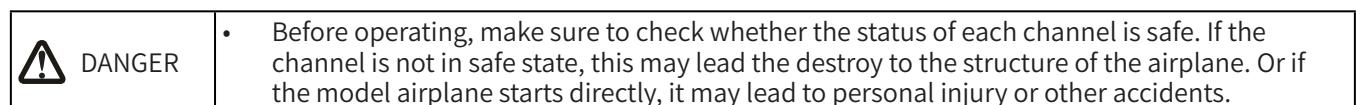

1. Enter Select model interface.
2. Tap the model that you want to delete.
3. Tap Delete and click Yes on the pop-up interface to complete. Afterwards, Tap to return to the previous interface.

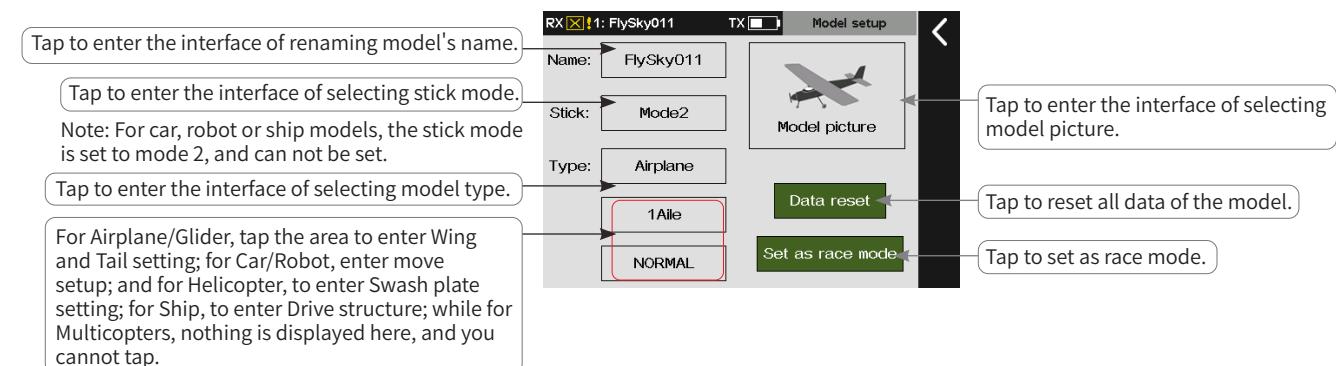

Note: The model currently in use can not be deleted.

7.3 Model Setup

Note: This function was updated for version 1.0.77.

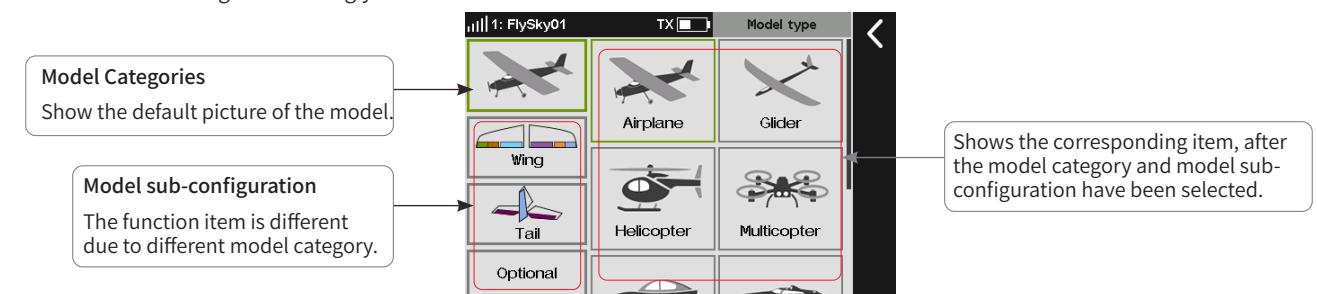

PL18 transmitter includes a variety of options for models, including Airplanes, helicopters, gliders, multicopters, cars, boats and robots. You can set the related settings of models, such as configurations and functions.

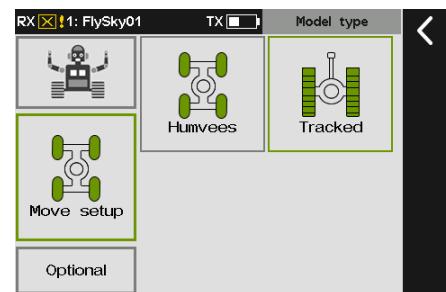

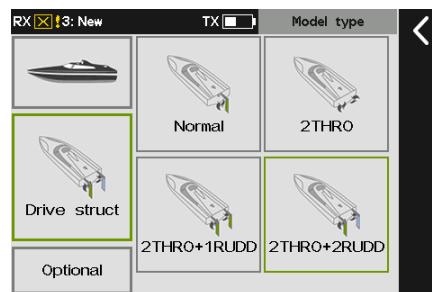

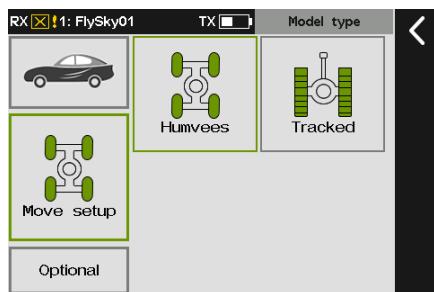

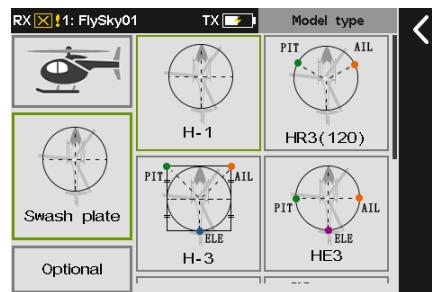

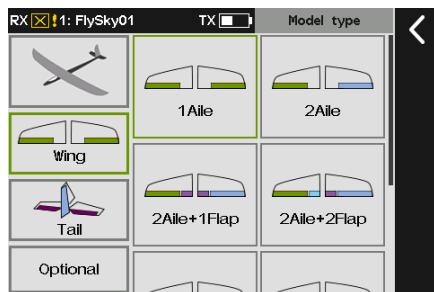

Model Type Setup

Sets model type and related parameters and functions. For Airplane/Glider, you can set Wing, Tail and Optional. For Helicopter, you can set Swash plate and Optional. For Car and Robot, you can set Move setup and Optional.

Note: If the model type is changed, the model data will be reset and the sub-configuration will be changed, as well as the function assignment interface will be changed accordingly.

The parameters and optional functions for different model type may differ.

Take the airplane for example, the setting steps are as follows. For the related setting of other models, refer to the steps below.

Setup:

1. Enter Model type interface.
2. Click Wing directly as the airplane is the default model, then Tap the appropriate wing configuration according to the actual model. Afterwards, it goes to the next setting automatically.
3. Click the appropriate tail configuration according to the actual model, then it goes to the next setting automatically.
4. Click the appropriate function item according to the actual model. Afterwards, click to return to the previous interface.

Note: The optional function items vary with different model types. For example, for the Airplane, you can set the Rudder wheel, Gear and so on, but for the Ship, the Wave and the Grip can be set.

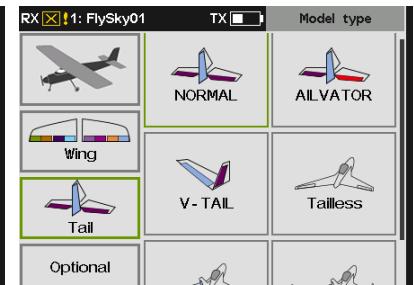

(1) Wing configuration

(2) Tail configuration

Note: For Tail configuration, when you set two ailerons or above for the Wing, then some configuration items related to tailless will display.

Tap to set the quantity. You can set more than one for some functions, for the Throttle, there are up to 4.

微信公众号

Bilibili

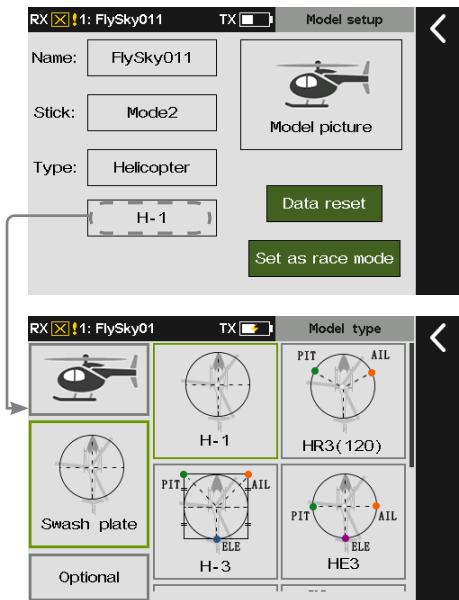

Website

Facebook

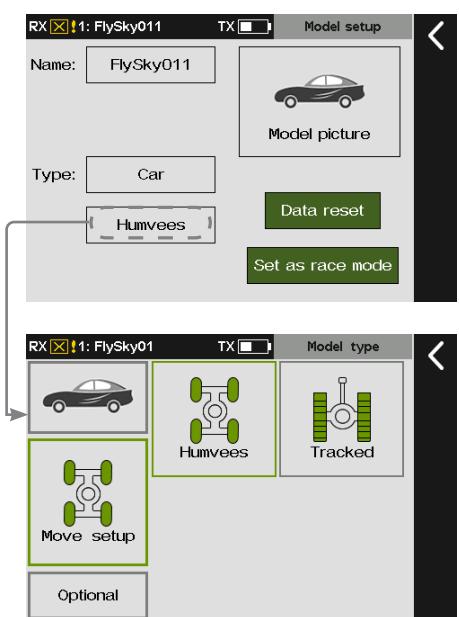

For Helicopter, follow the steps below to change the swash plate type.

1. Enter Model setup interface.
2. Tap H-1.
3. Tap the appropriate swash plate according to the actual model. Afterwards, click  to return to the previous interface.

For Car or Robot, follow the steps below to change the move setup.

1. Enter Model setup interface.
2. Tap Humvees.
3. Tap the appropriate item according to the actual model. Afterwards, click  to return to the previous interface.

7.3.1 For Racing

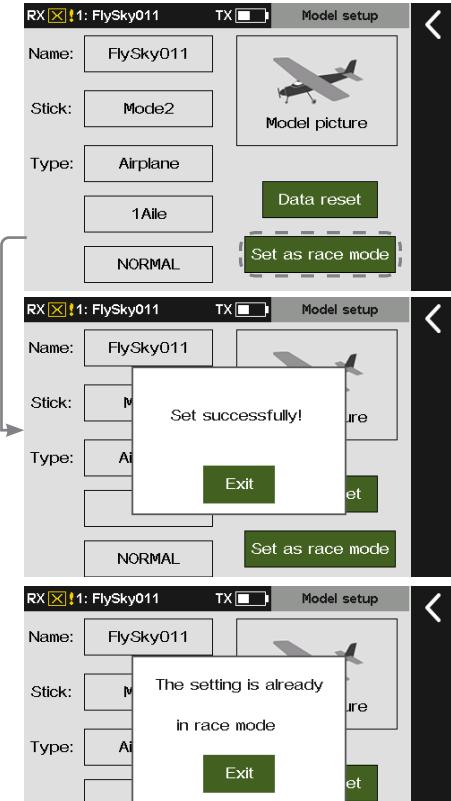

Note: This function was added in version 1.0.77.

This function is used to quickly disable the **Low signal alarm** and **Telemetry loss** alarm, effectively turning off the related signal alarms. It is recommended to use this function to disable the **Low signal alarm** and **Telemetry loss** before the race; after the race, you can decide whether to re-enable these two alarm functions based on the actual usage scenario (to enable, navigate to **Home1 > Basic > RX Setting**).

Setup:

1. Enter Model setup interface.
2. Tap **Set as race mode**, and the system will pop up a message indicating the setting is successful; tap **Exit** to close the pop-up window.

If you tap **Set as race mode** again, a pop-up message will indicate that the system is already in race mode, meaning the relevant alarms have been disabled; tap **Exit** to close the pop-up window.

7.4 Reverse

To reverse the output direction of each channel.

This function can be used to correct the direction of the servo action which is opposite to the intended operation. Due to different servo types or servo installation methods, servo directions can be set for 18 channels.

Normal: Indicates that the channel output is the default direction.

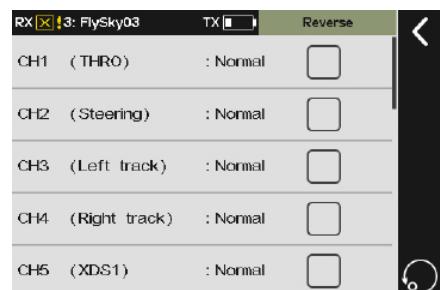

Reverse: Indicates that the channel's direction has been reversed.

Notes:

1. If a new model is connected, make sure the corresponding channel of the servo is correct.
2. Move the stick, switch or knob related to channels to make sure that the direction of each channel is correct.

Setup:

Tap the box at the right of the channel name to toggle reverse for that channel. If there is a tick in the box, it means that the channel is reversed.

微信公众号

Bilibili

Website

Facebook

7.5 Channel Route

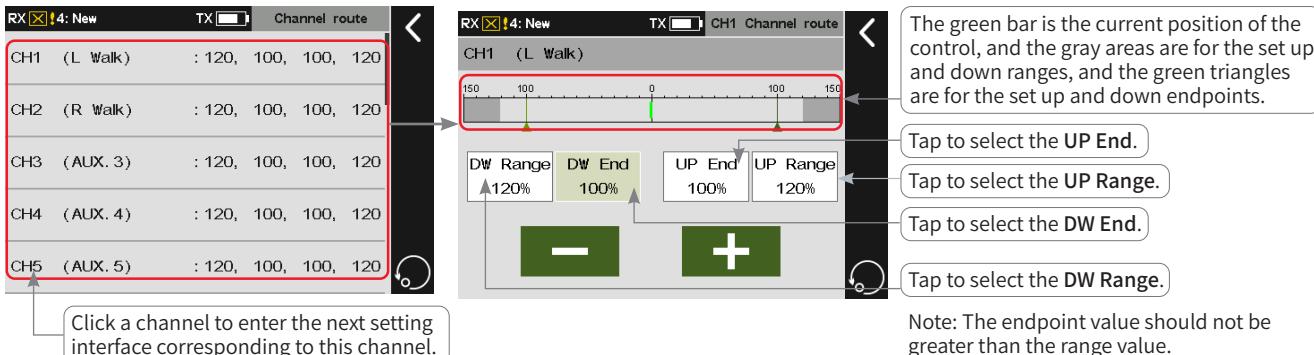

Note: Add channel range (Up/Down) to channel route for version 1.0.49 or later.

Changes the max range of movement and the movement range limitation(minimum value, maximum value) for each channel.

End is used to set the max of movement value for the travel range of the servo. **Range** is used to set the limited value for the travel range. After **Range** is set, even if the mixing function increases the travel value of the servo, the servo movement range will not exceed the range value, thus to protect the servo.

When the servo neutral position deviates too much from the position required for the configuration, the position adjustment will not achieve a desired effect by this function. Please adjust the servo neutral position first.

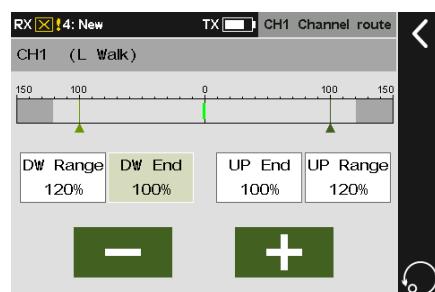

With this function, you can adjust the maximum servo movement of 18 channels respectively.

Setup:

1. Tap the channel to be adjusted and enter the setting interface.
2. Tap DW Range 120%.
3. Click + or - to set the appropriate travel range value. Afterwards, click **↶** to return to the previous interface.

For Low End, Up Range and Up End, refer to DW Range for function settings.

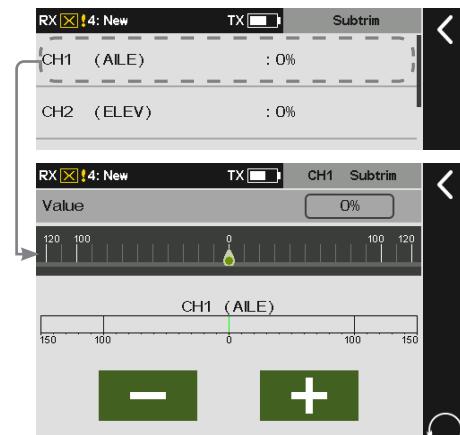

7.6 Subtrim

To adjust the neutral position of each servo.

This function can be used to solve the problem of angle difference between the servo and model structure when the servo is installed, or due to the structural inherent clearance of the servo. When you set the subtrim, toggle the trim to the neutral position first.

Setup:

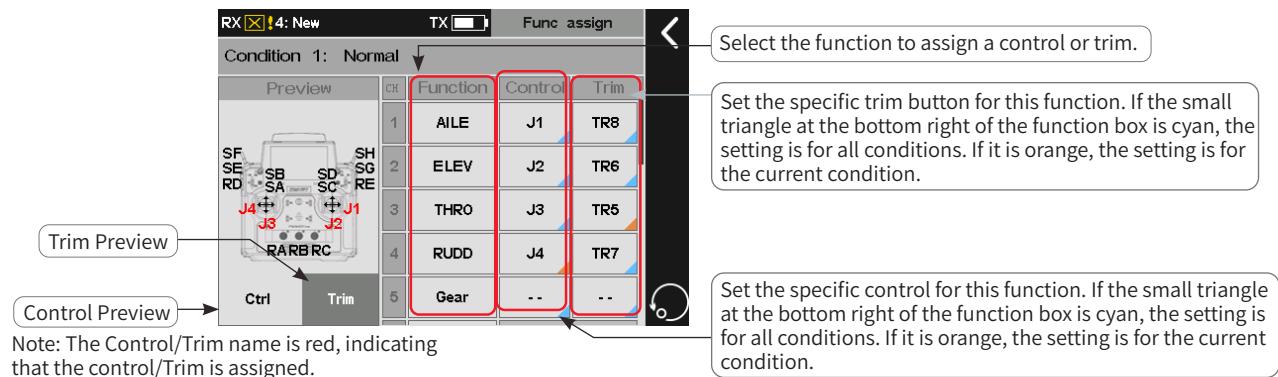

1. Click a channel you want to adjust to enter.
2. Click + or - to adjust the neutral position value of the channel to the desired point. Then, click **↶** to return to the previous interface.

7.7 Function Assignment

Note: The TEI option is added for version 1.0.70 or later.

Assign functions, controls and trim buttons to all channels. By default, the functions are assigned by model types after a new model is created. You can set the function here if you want to assign according to your habits.

7.7.1 Assigning Function Items

To set the function controlled by each channel.

Setup:

1. Tap the function that needs to be set and enter the next interface.
2. Tap the appropriate function.
3. If you want to create a AUX.(auxiliary) channel for the the control, tap Custom:(AUX.1) and enter a appropriate name on the pop-up interface, then, click to return to the previous interface.

Note: The custom channel name should be defined separately for different languages.

7.7.2 Control Assign

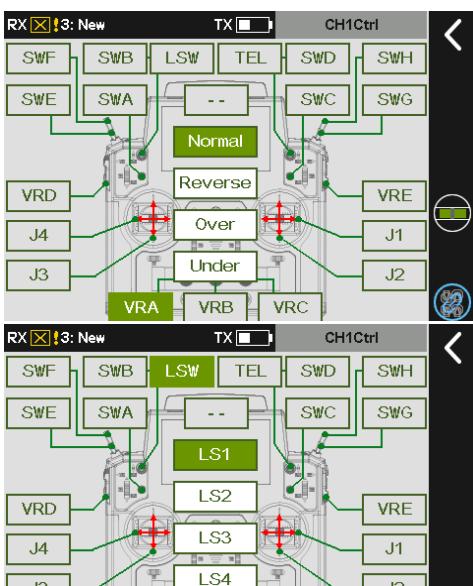

To set specific controls corresponding to each channel.

The controls that can be assigned are SWA~SWG switches, LS1~LS4 logic switches, J1~J4 sticks, VRA~VRE trim knobs and TEL telemetry controls.

Setup:

1. Tap the control you want to assign to enter the setting interface.
2. Tap **Control** on the interface or toggle the control on the transmitter to select it. Then the control assignment is completed.

Note: If you assign a logic switch or telemetry switch as a function control, you can only complete the assignment by clicking [LSW] or [TEL] on the interface, and then clicking the appropriate switch.

微信公众号

Bilibili

Website

Facebook

You can set the related parameters after the control assignment is completed. The parameters are different for different controls.

- For J1-J4 or VR consecutive kind switches, you can select Normal, Reverse, Over and Under.

Normal means that the corresponding control ratio changes from "-100% to 100%" when the control is moved from "down" to "up".

It is conversely for **Reverse**. In other words, When the consecutive switches are moved from "down" to "up", the corresponding control ratio changes from "100% to -100%".

For **Over** (Up side) or **Under** (Down side), The control ratio only switches between -100% and 100%, and the middle area is the hysteresis area. Selecting **Up side** means the control ratio is 100% in the high position and -100% in the low position. It is conversely for **Under**.

Take **VRA** as an example.

Setup:

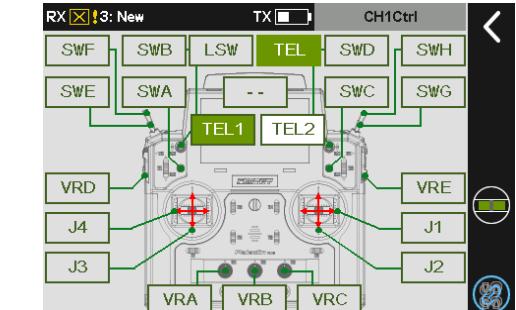

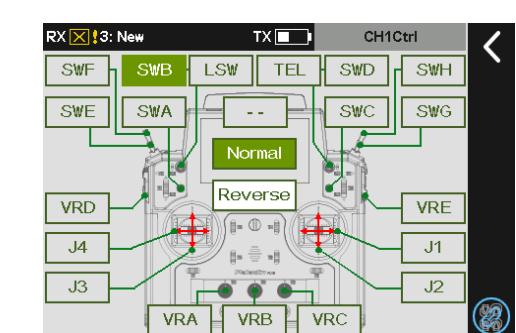

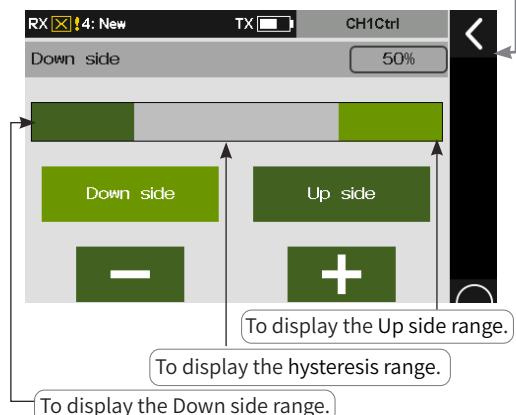

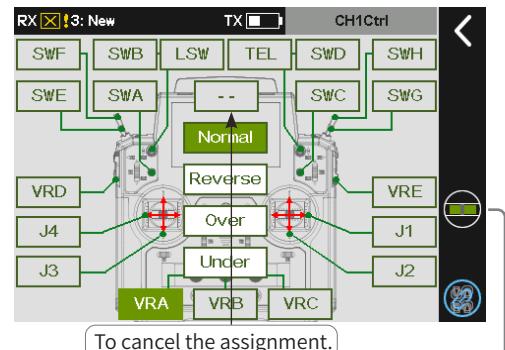

- Tap **VRA**, then click **Normal** or **Reverse**.
- Click **Over**, then click to enter the next interface. After selecting **Down side** or **Up side**, the selected function item turns to light green, click + or - to adjust the **Up-side** and **Down-side** values to the desired point. Then, click to return to the previous interface.

Note: You can click to choose to set only for the current condition or set for all conditions.

- For switches named after **SW** characters, you can set **Normal** or **Reverse**.

Normal means the control ratio is -100% when the control position is in the low position and 100% when the control position is in the high position (the neutral position control ratio in the three-level switch is 0%). It is conversely for **Reverse**. In other words, the control ratio of SW switches is 100% in the low position and -100% in the high position.

- For Logic switches, you cannot set the parameters. When the control is **ON**, it means the control ratio is 100%. **OFF** means the control ratio is -100%.
- For **TEL** control, you can set the parameters in **Telemetry Control** function, to use the realtime value obtained as a control.

7.7.3 Function Trim Assignment

To assign trim buttons corresponding to each channel.

Setup:

1. Enter Trim interface,
2. Tap the trim button on the interface or toggle the trim button you want to assign. Then the trim assignment is completed.

You can set the related parameters for the trim button after the trim assignment is completed.

Trim mode and **Trim rate** can be set.

In the **trim mode**, you can select **Normal**, **Cen Max** (center MAX), **H-Max**(high-end MAX)and **L-Max**(low-end MAX).

Normal means normal trimming (linear) operation.

Cen Max means the maximum trim adjustment in the neutral position, and no trim adjustment in the lowest and highest positions.

H-Max means when the function control is at the highest position, the trim adjustment is at its maximum; as the control approaches the lower end, the adjustment gradually decreases until it reduces to 0 at the lowest position.

L-Max means when the function control is at the lowest position, the trim adjustment is at its maximum; as the control approaches the higher end, the adjustment gradually decreases until it reduces to 0 at the highest position.

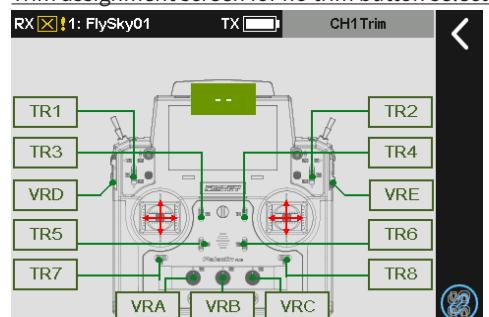

Trim rate A total travel range of the channel that can be controlled by the trim knob. A negative value indicates the reverse.

Note: The setting of trim rate is the same as that of trim mode in all the other modes. When the trim is not assigned, the trim setting cannot be set and the parameters that have been set will be kept.

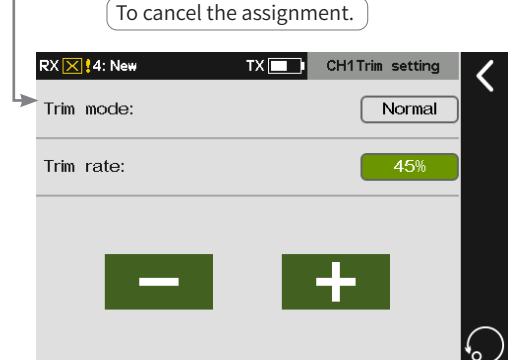

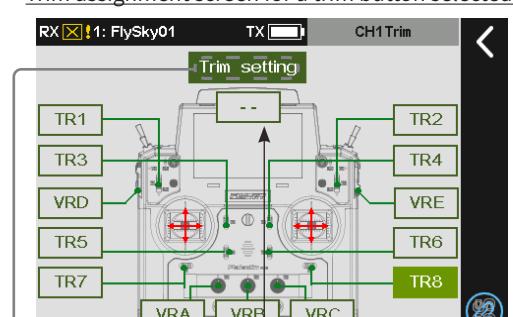

Follow the steps below to set:

1. Tap **Trim setting** to enter the trim setting interface.
2. Click the option box on the right of **Trim mode**, and select the appropriate trim mode according to the description above.
3. Tap **Trim rate** and click + or - to adjust the trim rate value to the desired point. Then, click  to return to the previous interface.

Trim assignment screen for no trim button selected.

Trim assignment screen for a trim button selected.

Facebook

7.8 Trim

Note: This function is available for version 1.0.65 or later.

You can view the trim values of TR1 to TR8 and VRA to VRE in this preview interface. For TR1 to TR8, you can set the appropriate step value and the backup trim value for current condition/all condition. And for VRA to VRE, you can only set the backup trim value.

During use, a model control surfaces may occur a deflexion based on some situations, such as centre-of-gravity shift or anti-torque force produced by aerodynamics. You can use this function to correct it during flight to keep stable state. Please re-adjust the model in case of the overall excessive offset of the model cannot be corrected by trims function.

7.8.1 Setting TR1 Trim

Sets the trim step value. You can set it for all conditions or for the current condition. It is only supports one-time storage.

Backup and call setting for TR1 trim button

Sets backup value for TR1 trim button.

Setup:

1. Tap TR1 to enter the setting interface, the previous set backup value is displayed in **Backup trim** area.
2. Push or pull the TR1 button on the transmitter to a desired value.
3. Click **Rebuild** to set it to the backup value.
4. Click **Call** to call the backup value. Then click **Back** to return to the previous interface.

Step value setting for TR1 trim button

Sets step value for TR1 trim button.

Setup:

1. Tap TR1 to enter the setting interface.
2. Click **Step Value**, click + or - to adjust the value to the appropriate value. Then click **Back** to return to the previous interface.

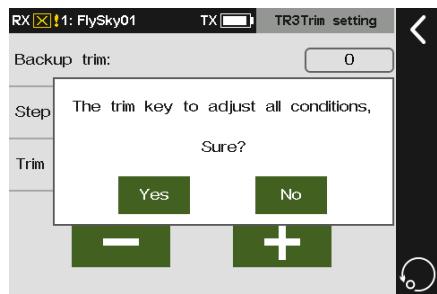

Trim adjustment setting for TR1 trim button

Sets trim adjustment for **TR1** trim button.

1. Tap **TR1** to enter the setting interface.
2. Click **Trim adjustment** and click **Yes** to adjust the condition. Then click **◀** to return to the previous interface.

Note: When for all conditions is activated, trim values in all conditions will call the current trim value. Please operate with caution.

For **TR2** to **TR8** settings, please refer to the relevant settings of **TR1**.

7.8.2 Setting VRA Trim

Sets the backup trim value. The backup value is for reference only and can not be called.

Setup:

1. Tap to enter the setting interface, the previous set backup value is displayed in **Backup trim** area.
2. Turn **VRA** clockwise or counterclockwise to adjust the trim value to the desired value. Then, click **◀** to return to the previous interface.

For **VRB** to **VRE** settings, please refer to the relevant settings of **VRA**.

7.9 Sensors

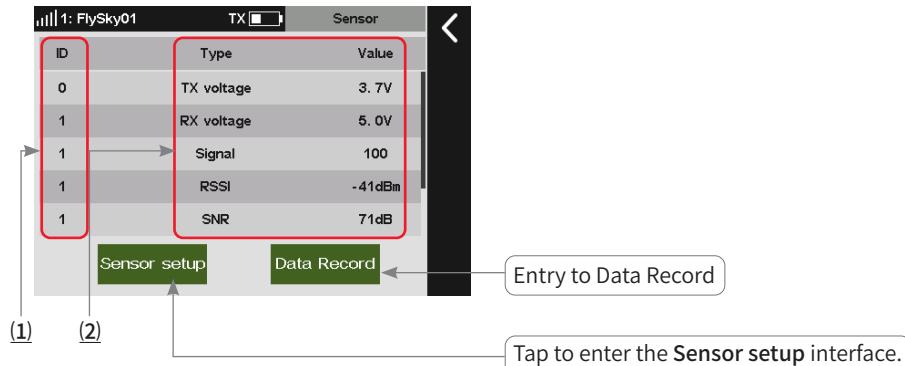

Note: This function is available for version 1.0.65 or later.

To set or view the related data of the sensors.

7.9.1 Displaying Sensors

Note: This function has been updated in version 1.0.73 and later.

This list shows all sensors connected, including sensor type, number and real-time data.

(1) Display Sensor ID

To display numbers of sensors. By default, the ID number 0 represents the transmitter, and the ID number 1 represents the receiver or the primary receiver(two receivers connected). And for ID number 2 represents the slave receiver or the the first external sensor connected to the receiver, and so on. This list data is displayed in real-time. When a sensor is connected to the receiver, this list will be refreshed to display the new sensor's ID. And when the sensor is disconnected, the ID related to this sensor will disappear.

(2) Display Sensor Type and information returned from receiver

This list data is displayed in real-time. When a sensor is connected to the receiver, this list will be refreshed to display the new sensor's type and information. And when the sensor is disconnected, the type and data related to this sensor will disappear.

The following is the descriptions about the parameters of the transmitter and receiver.

TX Voltage: To display the voltage for the transmitter's battery.

RX Voltage: To display the power supply voltage for the receiver.

Signal (strength): To display the signal strength between the transmitter and the receiver. It is calculated by using SNR. The signal strength will be displayed as a value between 0 and 100. In the same environment, the farther the distance, the smaller the value. If the signal strength drops to 4 or below, the system will alert the user.

SNR: The signal-to-noise ratio refers to the decibel difference between the signal and the noise received by the receiver. The signal-to-noise ratio equals the data of RSSI subtract the data of Noise, which is a decisive parameter in the overall quality of the signal. If the SNR drops below 11, reduce the range quickly to prevent loss of control.

RSSI: Indicates the power of the signal received by the receiver. 0 to -40 dBm: Indicates that the distance between transmitter and receiver is close and the communication quality is best. -40 dBm to -85 dBm: The communication quality is good. Less than -85 dBm: Indicates that there is an obstacle between the transmitter and receiver or the distance is far. Please shorten the control distance to avoid losing control.

Noise: Noise is generated due to interference from other nearby transmitters such as WIFI. In places where there are too many transmitters, excessive noise will affect the remote-controlled distance.

7.9.2 Sensor Setup

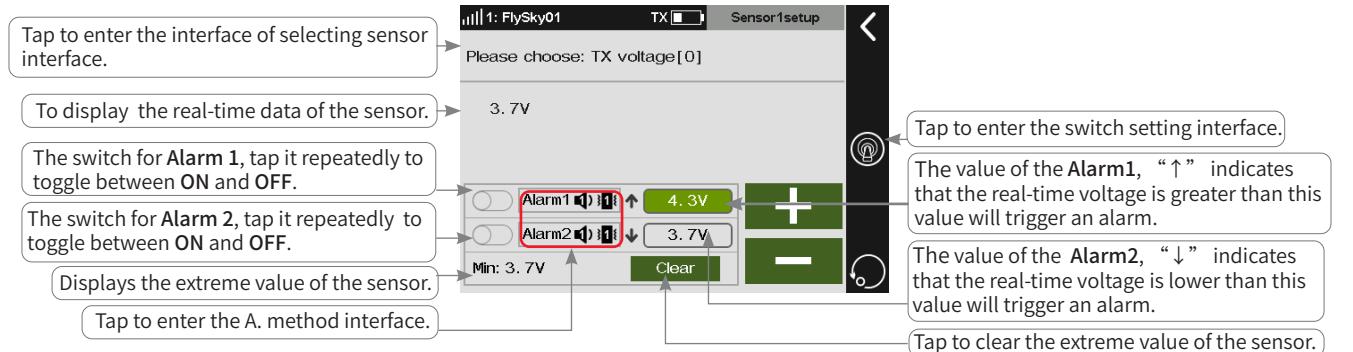

Note: This function has been updated in version 1.0.73 and later.

Sets the sensors displayed in **Home2**. You can set the alarm threshold for a selected sensor, or perform the special sensor settings.

You can set the alarm function of the sensor connected to the transmitter. After the settings, the real-time value may trigger an alarm. In case of a sensor with an extreme value, the extreme value can be displayed and the extreme value can be cleared through a switch setting.

Selects a sensor and sets its parameters.

Changes the sensor displayed here. Take **TX voltage** as an example. You can set two groups of alarm voltages. The extreme value can be displayed if the sensor supports extrem value and the extreme value can be cleared through a switch setting.

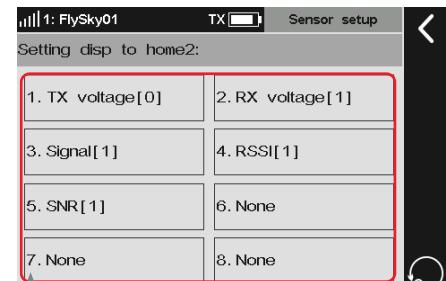

Setup:

1. Click **1.TX voltage [0]** to enter the setting interface.
2. To change the sensor displayed here, click **Please choose: TX voltage [0]** to enter the setting interface. Select the sensor to be displayed. Click to return to the previous interface.
3. You can set two groups of alarm voltages. Tap the box to the right side of Alarm 1 or Alarm 2 and click +/- to set the appropriate value.
4. Tap **Alarm 1** or **Alarm 2** to set the alarm mode, namely whether to have sound and vibration, and set the type of sound and vibration. After setting, click to go back.
5. Click **Clean** to clear the extreme value, or click to set the switch for clearing the extreme value. Click to return to the previous interface.

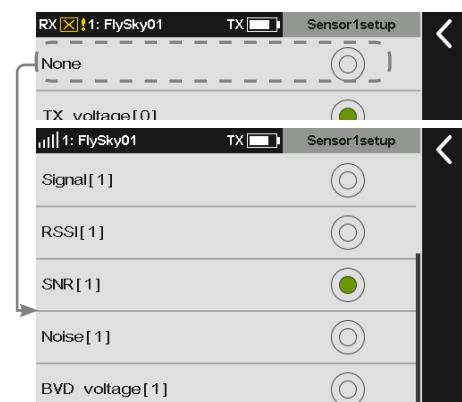

Notes:

1. The setting only takes effect for the current sensor. When you select a different sensor, the set parameters will be cleared. You cannot select a sensor that is not connected. If a sensor is not connected, you should not select the sensor.
2. The extreme value is the minimum value recorded at the last power-on operation. After clicking Clean, the displayed extreme value changes to the minimum value at the current state. Some sensors may not support the settings of the extreme value. Some detected values are maximum, some are minimum, while some sensors are not supported to detect extreme value.
3. Sensors may vary with alarm types. For example, the signal strength only supports the alarm below the set value. In this case, the first triggered alarm value causes a low alarm frequency (once a minute). When two alarm values are triggered, there is a high alarm frequency (once every ten seconds). While for the sensor which supports one alarm below the set value and the other above the alarm, when the alarm value is triggered, the frequency is once every ten seconds.
4. For special sensor settings, the entrance will be in the real-time parameter display area.
5. If the system sound and alarm sound are turned off (General>Sound>System sound/Alarm sound), the alarm will not on even if the alarm is enabled here.

For other sensor setting, refer to the rated setting of **TX voltage**.

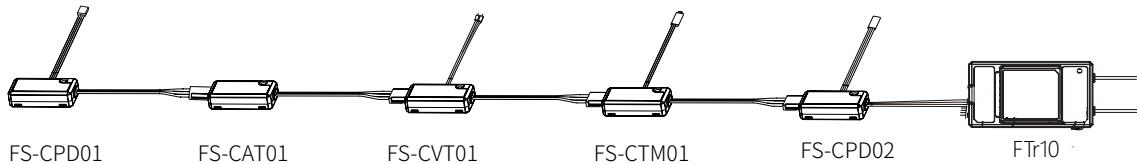

Tap sensor 1 ~ sensor 8 to enter the corresponding sensor setting interface respectively.

Note: To display the sensor connected. If a sensor is not connected, you should not select the sensor.

The following descriptions are installations and function settings about some i-BUS sensor modules. Take the FTr10 receiver and the PL18 transmitter as an example, connect the sensor to the SENS interface of the FTr10 receiver, and the other sensor can be connected to the IN interface of this sensor in turns. The connection diagram between the sensors and the receiver is as shown below.

Notes:

1. For the enhanced edition receiver, before connecting the sensor to the receiver, you need set the output signal type for NPA(Newport A) to i-BUS-IN via Basic > RX setting > Custom port protocol first.
2. The abbreviations for the Newports are for NPA, NPB, NPC and NPD, the enhanced edition receiver supports up to 4 newports.
3. The system only supports one Newport interface is set to i-BUS-IN, and at the same time the other newports cannot be set to i-BUS2.

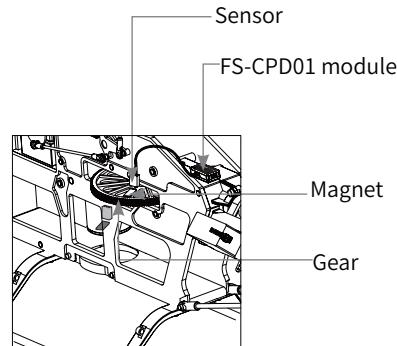

FS-CPD01: Magnetic Induction Speed Acquisition Module

Be used to measure the speed of the motor. Monitor the real-time data of detection through the **Sensor** interface.

Installation steps:

1. Place the sensor next to the magnet, which is fixed to the spinning part of a model such as the blades of a plane rotor.
Note: Make sure that the sensor is within 2mm of the magnet and the north pole or south pole of the magnet is parallel to the sensor.
2. Connect the FS-CPD01 sensor to the SENS interface of the FTr10 receiver.
3. Turn on the transmitter and enter Home1 > Basic > Sensor. Try to turn the gear around, if the RPM-SP value changes, then the installation is successful, otherwise repeat the above steps.

Note: RPM-SP means the sensor is testing the speed of the motor. 3 is the sensor ID and refers to the third sensor. 12rpm is the speed measurement value.

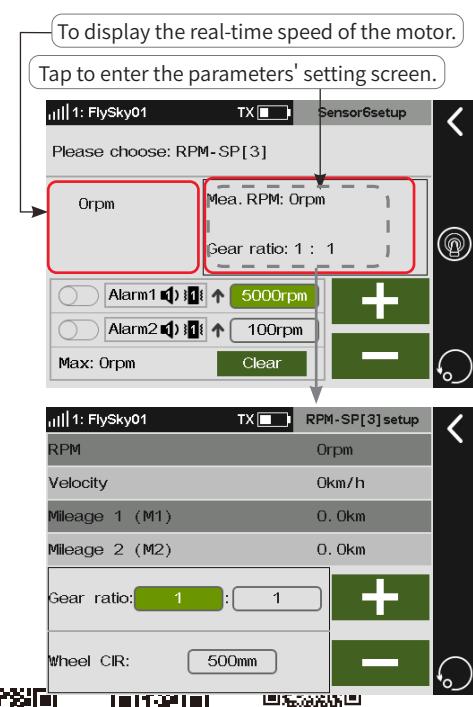

The interface of the RPM-SP[3] is shown at the right. For the **Alarm** and **extreme value**, refer to the related setting of the **TX voltage**. For the setting of **RPM**, follow the steps below:

Setup:

1. Tap to area showed on the picture to enter the setting interface.
2. Click the function box right to the **Gear ratio** to select it. Click +/- to set the appropriate value.
3. Click the function box right to the **Wheel CIR** to select it. Click +/- to set the appropriate value.

Notes:

1. The gear ratio is the rate of the number of gears of the actual detection speed to the number of gears of the target monitoring speed.
2. When it is not convenient to install a sensor for a device with the pre-monitoring speed, you can try to monitor the rotational speed of the device by testing the rotational speed of the drive components and setting the appropriate gear ratio. For example, monitor the speed of the rotating shaft by monitoring the rotational speed of the paddle.
3. For a wheeled vehicle model, the speed of the vehicle can be obtained based on the set wheel circumference and the rotational speed value of the wheels.

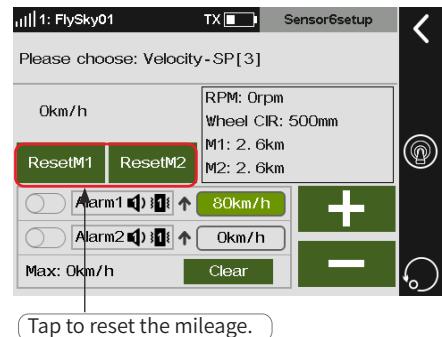

The interface of the Velocity-SP is shown on the right. For the setting of **Alarm** and **extreme value**, refer to the related setting of the TX voltage. For other setting of **Speed**, follow the steps below:

Setup:

1. To reset M(mileage)1 or M2 by Taping **Reset M1** or **Reset M2**.
2. You can also set a switch to reset M1 or M2. Click to set the appropriate switch.

Note: The system calculates the speed based on the wheel circumference and the monitored rotational speed, and then calculates the mileage based on time. Therefore, the setting values of the gear ratio and circumference will affect the speed and mileage.

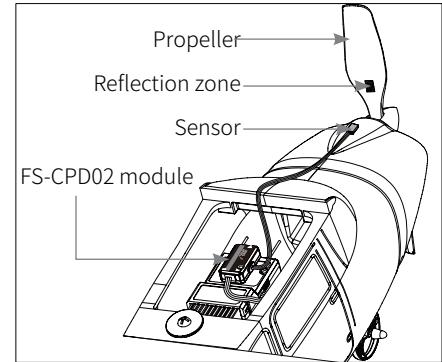

FS-CPD02: Optical Induction Speed Acquisition Module

Be used to measure the speed of the motor by light sensor. Monitor the real-time data of detection.

Installation steps:

1. Mount the sensor and the reflective sticker to the axial rotation position.
Note: Keep the reflective sticker flat and perpendicular to the sensor, and the distance between the sensor and the sticker is moderate.
2. Connect the FS-CPD02 sensor to the SENS interface of the FTr10 receiver.
3. Turn on the transmitter and enter Home1 > Basic > Sensor, then turn the rotating element, if the RPM-SP value changes, then the installation is successful, otherwise repeat the above steps.

The function setting of FS-CPD02, refer to related setting of FS-CPD01. Please notice when you set the gear ration, if you want to detect the propellers, the gear ratio is the ratio of 1 to the number of propellers.

FS-CTM01: Temperature Acquisition Module

This sensor is used to monitor the temperature of a chosen part of the model.

Installation steps:

1. Use soft double-sided tape to attach the FS-CTM01 sensor to the object you want to measure (e.g., motor, battery). Make sure the sensor is pressed against the surface snugly for the best readings.
2. Connect the FS-CTM01 sensor to the SENS interface of the FTr10 receiver.
3. Turn on the transmitter and enter Home1 > Basic > Sensor, if the Temperature displays, it indicates that the installation is successful, otherwise repeat the above steps.

Note: Temperature means the sensor is testing the temperature; 26.4° C is the measured value.

The function setting of FS-CTM01, refer to related setting of FS-CPD01.

Bilibili

Website

Facebook

FS-CVT01 Voltage Acquisition Module

The FS-CVT01 function is used to monitor the model battery voltage.

Installation steps:

1. Turn on the transmitter and enter **Home1 > Basic > Sensor**. If the sensor displays External Voltage data, then installation is complete. Otherwise repeat the above steps.
2. Connect the FS-CVT01 sensor to the **SENS** interface of the FTr10 receiver.
3. Insert the red and black wire pins into the port on the battery. Red is positive and black is negative.

Note: **Ext voltage** means the sensor is testing the voltage; 3.2V is the measured voltage value.

The function setting of FS-CVT01, refer to descriptions above.

FS-CAT01 Altitude Pressure Sensor

To detect the altitude of the model.

Installation steps:

1. Connect the FS-CAT01 sensor to the **SENS** interface of the FTr10 receiver.
2. Use double sided soft tape to snugly fix the FS-CAT01 sensor in place.
3. Turn on the transmitter and enter **Home1 > Basic > Sensor**. If the sensor displays **Height-PR** data, then installation is complete. Otherwise repeat the above steps.

Note: **Height-PR** means the sensor is testing the altitude; 14m is the actual measured height value.

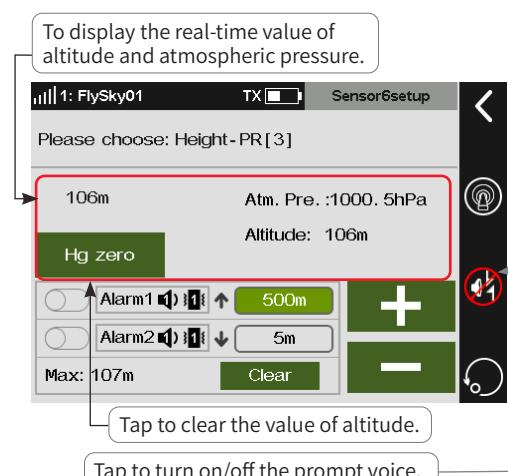

The interface of the **Height-PR** is shown at the right. For the **Alarm** and **extreme value**, refer to the related setting of the **TX voltage**. For the setting of **Height**, follow the steps below:

Setup:

1. Tap **Hg zero** to clear the value of altitude or set a switch to clear it.
2. Tap **🔇** to turn on/off the prompt voice. Or set a switch to turn on/off the prompt voice, click **⬅** to return to the previous interface.

Notes:

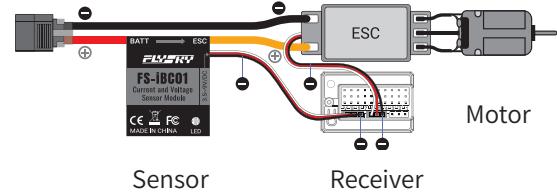

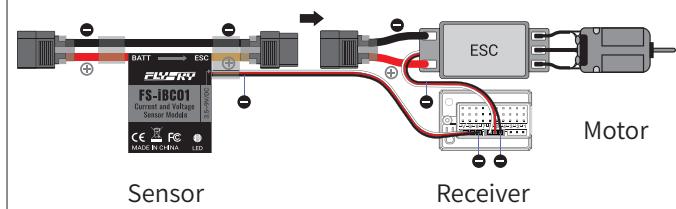

1. The altitude sensor collects the changes in the barometric pressure to determine the altitude. Airflow changes can cause some errors in monitoring.
2. When the volume of the beep is higher, it means the aircraft is ascending, and when the volume is lower, it means the aircraft is descending.

i-BUS2 Current and Voltage Sensor(FS-iBC01)*Note: This function has been added in version 1.0.73 and later.*

It is used to monitor the information such as the voltage, current and actual battery consumption capacity of the ESC in real time.

1. Use 3M stickers to fix the sensor at an appropriate location of the model. It should be noted that the fixed surface should be flat. You can also use a cable tie to tie it to the model. In this case, you should control the force.
2. Finish cable connecting according to the cable connecting digrams as shown. Make sure the cables are connected correctly.
3. Turn on the transmitter, set the protocol of NPA connected the sensor to i-BUS2 viaCustom port protocol first, then access Sensor via Basic function. When the "Type" column shows Voltage, Current, etc., and the corresponding values of voltage and current in "Value" column. It indicates that installation is successful. Otherwise, repeat the above steps.

Cable connecting method ICable connecting method II

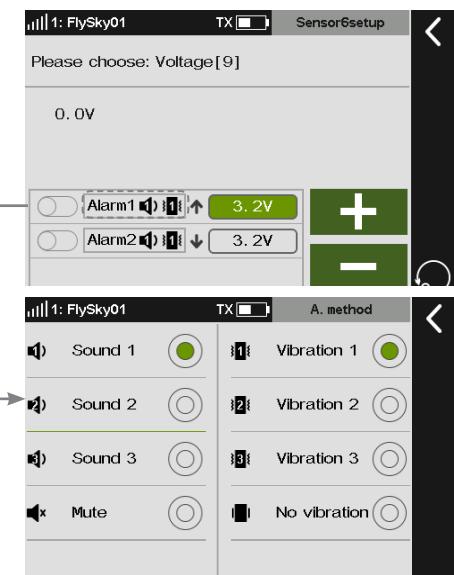

Note: Please refer to the FS-iBC01 manual for more details.

- Make sure to refer to the "Installation and Cable Connecting" section of the FS-iBC01 user manual for correct wiring. Otherwise, there may be an explosion or fire.

The sensor function can monitor or set the relevant parameters of the FS-iBC01 current and voltage sensor. The parameters can be monitored include: Current, Voltage, Max Voltage, Min Voltage, Con. Capacity, Power, Max Current, Avg. Current and Run Time. Among them, these four of Voltage, Current, Cons. Capacity and Power parameters can be set to alarm.

Refer to the ralated setting of **TX voltage** for function setup.

微信公众号

Bilibili

Website

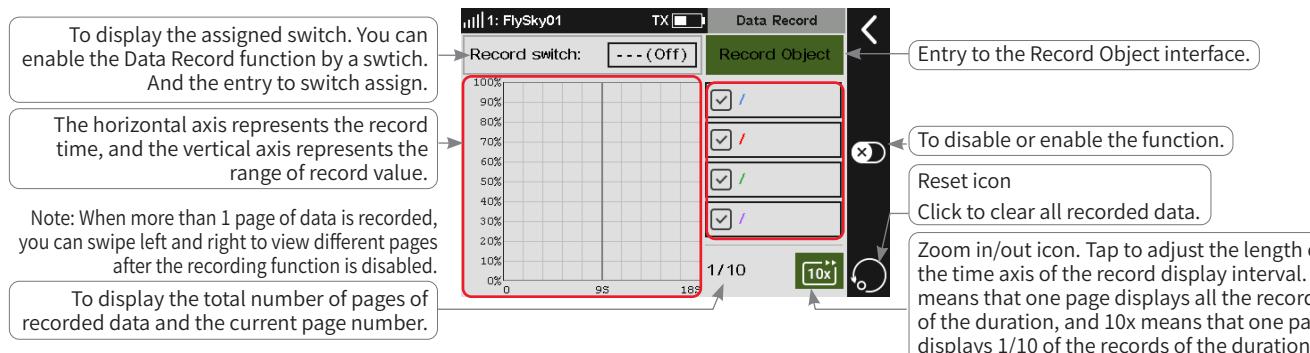

Facebook

Data Record

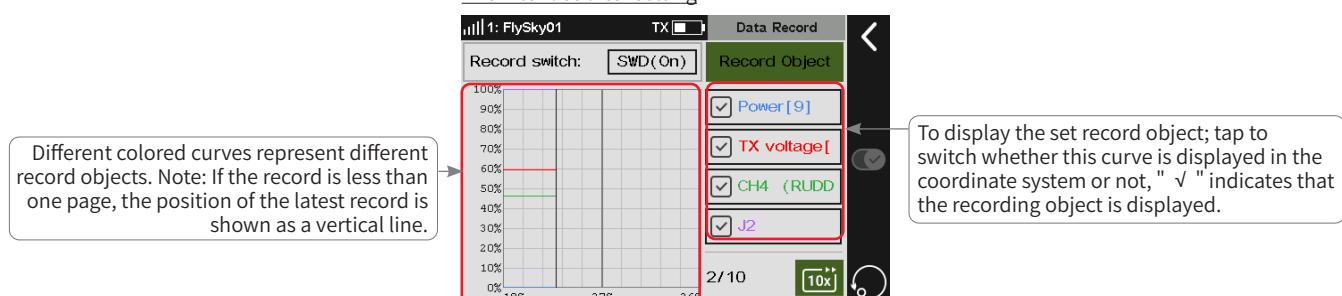

Note: This function has been added in version 1.0.73 and later.

This function is used to display and set the data-record information.

Four Record objects can be defined. The Record object can be set to Sensor Data, Output Channel or Stick or Knob. After the recording is enabled, the value changes of the recording object over a period of time can be recorded.

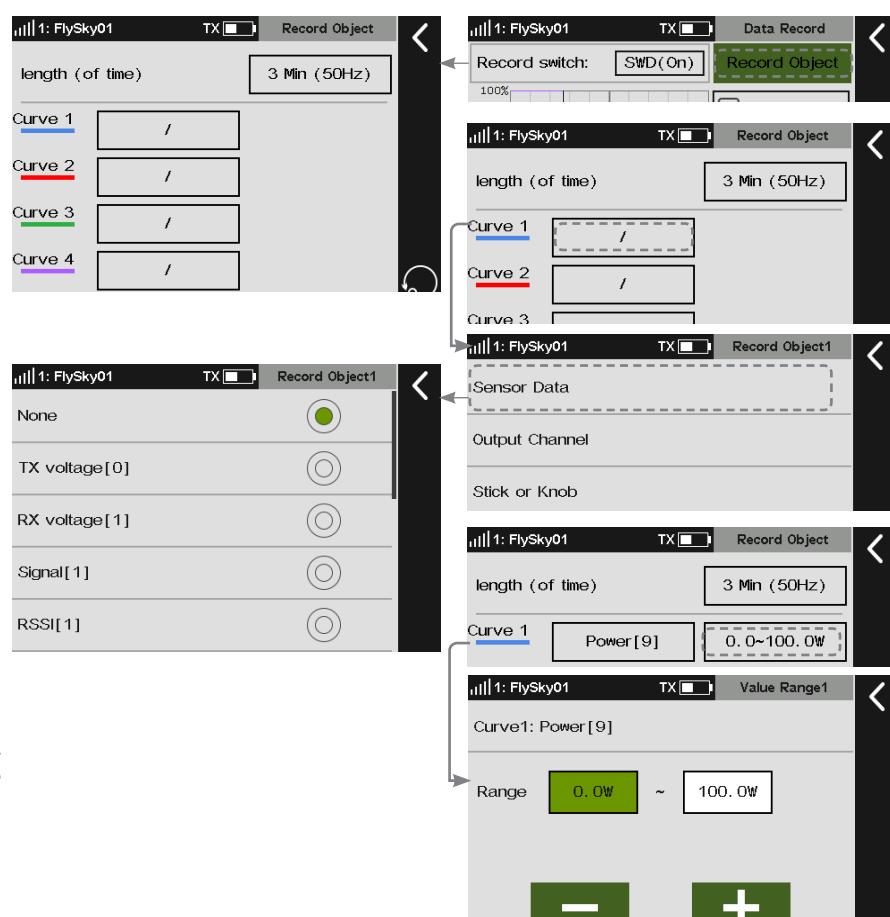

The interface after setting

Setup:

1. Tap Data Record to enter.
2. Tap to enable the Data Record, if you want to turn on it (tap to disable). Also a control can be assigned to enable or disable the function.
 - Tap the box to the right side of Record switch, then tap control on the interface or toggle the control on the transmitter to select it.
3. Tap Record Object to enter.
 - To set the Length (of time), tap the box to the right of the function. You can set the duration to 3 minutes (50Hz) or 30 minutes (5Hz).
 - Tap the box to the right of the Curve you want to set, select the object accordingly.

If the record object is set to a sensor, you can set its value range. Tap the "Value Range" area on the right side of the curve to enter; then you can set the minimum and maximum values of the range by using +/- . Tap to return.

7.10 Timers

Note: This function is available for version 1.0.49 or later.

This function allows you to set various timers, which are generally used to calculate the total model running time, competition specific time spent or transmitter running time, etc.

7.10.1 Timer 1/2

Note: This function has been updated in version 1.0.73 and later.

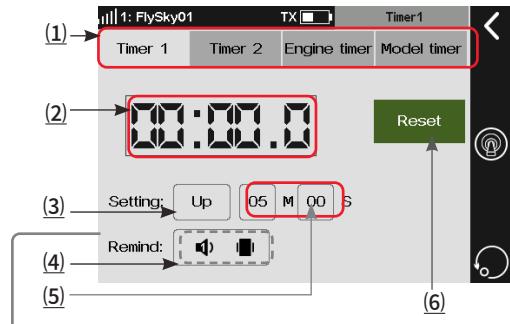

Timers 1 and Timers 2 have the same function. Only one timer setting method is introduced below.

Setup:

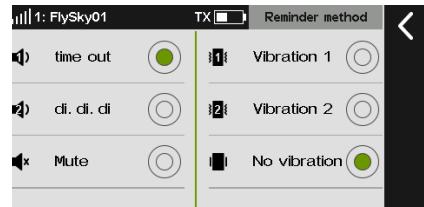

1. Tap Timer 1.
2. Tap Up to switch the timer type.
3. Tap the function box next to M or S, + or - appear, click + / - to adjust the value to the desired point.
4. Tap Sound to scroll through the reminder mode.
 - You can set whether to have sound and vibration as the reminder, and select the type of sound and vibration.
5. Click and set the switches for Start switch, Stop switch or Reset switch. You can start,stop or reset the timer by the switches. Then click to return to the previous interface.

Notes:

1. The timer start/stop switch is an action switch. If the stop switch is not assigned, the start switch is the timer stop switch in the period from its start to end. If two timers need to start at the same time and stop at different times, you can assign different stop switches to them. You can also switch the start/stop by clicking the display timer area of the interface. This function is very useful for electric glider competitions.
2. When Timer 1 or Timer 2 is set to remind, the system will send out a reminder when it reaches a minute sharp. It will also send out a countdown reminder 30 seconds before the end of this time.
3. If the system sound and alarm sound are turned off (General>Sound>System sound/Alarm sound), the alarm will not on even if the alarm is enabled here.

(1) Tap to select the timer.
 (2) Display the current time. Click repeatedly to toggle the start/stop timer.
 (3) Tap to select the timing method.
 (4) Tap to select the reminder mode.
 (5) Tap the box next to M(minute) or S(second). +/- appear. Then click +/- to set the appropriate time.
 (6) Tap to reset the time during the timing process.

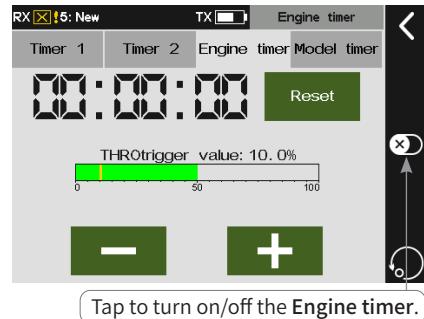

7.10.2 Engine Timer

Turn on the timer by setting the throttle trigger value and calculate the operating time of the throttle after the trigger value.

Setup:

1. Tap Engine timer.
2. Click + / - to set an appropriate trigger value.
3. Tap Reset to reset accumulated time. If the throttle exceeds the set value and when this function is activated. The timer will start. Then click to return to the previous interface.

Note: You need to activate this function manually as it is off by default.

7.10.3 Model Timer

To calculate total working time of the model.

Setup:

1. Tap Model timer,
2. Click to activate this function, then click to disable the function.
3. Tap Reset, then click Yes on the pop-up interface to reset the accumulated time. Then click to return to the previous interface.

微信公众号

Bilibili

Website

Facebook

7.11 RF Setting

Set and display RF-related parameters/data, e.g., enable/disable RF function, type of RF, RF module firmware upgrade, RF module related information, etc.

7.11.1 Transmit

To enable or disable transmit function. If you don't need the transmit function, e.g., the transmitter works as a USB simulator, you can disable the transmit function by this function.

Setup:

Click the check box next to the **Transmit**. "√" means the function is activated.

Note: For safety, the RF function cannot be disabled if the receiver is turned on.

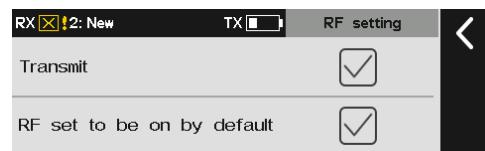

7.11.2 RF Set To Be On By Default

Used to set whether to enable transmit function when the transmitter is turned on. If the check box is not selected, the transmit function will not be enabled when the transmitter is turned on. If you need to use it, enable the transmit function via this interface.

Setup:

Click the check box next to the **RF set to be on by default**. "√" means the function is activated.

7.11.3 RF Type

Note: FRM303 and CRSF2 functions are added for version 1.0.70 or later.

Used to select an appropriate RF type as per the communication protocol of the receiver bound with the transmitter.

Both **FRM301** and **FRM303** (compatible with classic version receiver and enhanced version receiver) adopt AFHDS 3 protocol; **PPM** is for RF module using PPM protocol, **CRSF** for RF module using CRSF protocol, and **CRSF2** type is for Black Sheep RF module which is compatible with **CRSF2** protocol.

Setup:

1. Click **RF type** to enter the setting interface.
2. Tap the appropriate RF type and click **Yes** on the pop-up interface to finish. Then click **◀** to return to the previous interface.

Note: When the RF type is set to CRSF2 and the receiver is normally connected, the RSSI parameters and the currently connected flight control parameters can be obtained, including voltage, current and battery capacity. And the returned data can be set to alarm through **Sensor > Sensor setup**.

7.11.4 FRM303 RF Module

Note: This function is available for version 1.0.70 or later.

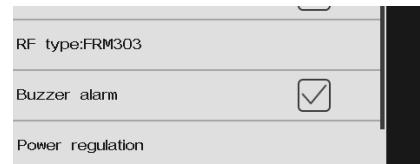

When the FRM303 RF module is used, you can use this function to set the RF type to FRM303. After setting, the RF buzzer alarm can be turned on or off in RF setting interface. After the buzzer is turned on, the alarm will sound in case of low signal and low voltage, as well as the temperature is too high or too low. In addition, three power versions are supported: non-adjustable Version, 25mW~1W version and 25mW~2W version.

Buzzer Alarm

To turn on/off buzzer alarm. The alarm function will be triggered when the RF module temperature is too high, or external power supply voltage is low, or the signal is low.

Setup:

Tap Buzzer alarm. " ✓ " means the function is activated.

Power Regulation

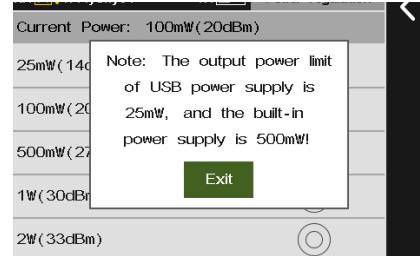

The power adjustment interface varies with different adjustable versions. Note that the power supply mode of the FRM303 RF module also affects the actual output power. That is, if the power set exceeds the limit range, the maximum power within the limit range will be output. When the power is switched to a power other than 25mW, a popup prompt window will come along with it as shown.

Setup:

1. Tap Power Regulation.
2. Tap an appropriate power item.

The Current Power returned

7.11.5 PPM Setting

When PPM is selected for RF type, a PPM setting function appears in the RF setting interface, where you can set the parameters related to PPM signals.

Signal polarity: By default (positive), high-level stands for valid signal. Some devices may require low-level for valid signal. Set the signal polarity to negative, and low-level represents valid signal.

Number of channels: To set the number of channels in one PPM signal. By default, each PPM signal contains 8 channels. You can set the number of channels as required.

Period: The time consumed to send a PPM signal. The period

微信公众号

Bilibili

Website

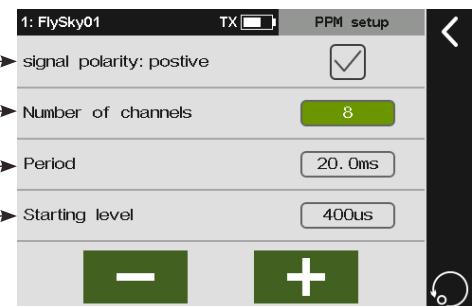

Facebook

of standard 8-channel PPM signal is 20ms. For fewer channels, you can set shorter periods. As the required time to send a signal is shorter, the delay is reduced. In period setting, you shorten the time of idle periods only, not that of the effective signal. Therefore, setting a shorter period will not reduce the number of signal channels. When the number of channels increases, and the transmission time of effective signals exceeds the period, the system will minimize the idle periods when processing the signals, and the interface setting will not change accordingly.

Starting level: Identifies the start index time of PPM signals. The default value is 400 us. You can set an appropriate value from 100us to 700us as needed.

Setup:

1. Tap **Signal polarity** to set the the signal polarity, "✓" means the signal is postive.
2. Tap **Number of channels**. Then click + / - to set an appropriate number of channels.
3. Click **Period**. Then click + / - to set an appropriate period value.
4. Tap **Starting level** and click + / - to set an appropriate value. Then click ↺ to return to the previous interface.

- (1) Tap to switch the signal polarity.
- (2) Tap to select Number of channels.
- (3) Tap to select Period.
- (4) Tap to select Starting level.

7.11.6 RF firmware Updating

To upgrade the RF firmware . It is only available when the RF type is set to FRM301.

Setup:

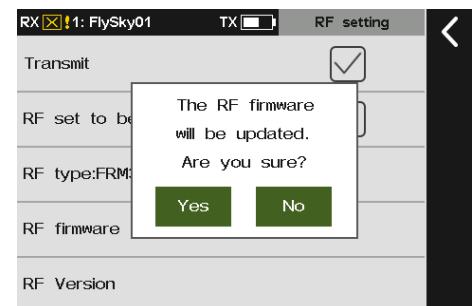

1. Tap **RF firmware**.
2. Click **Yes** on the pop-up interface to enter the updating state.

7.11.7 RF Version

To view related information about the RF module.

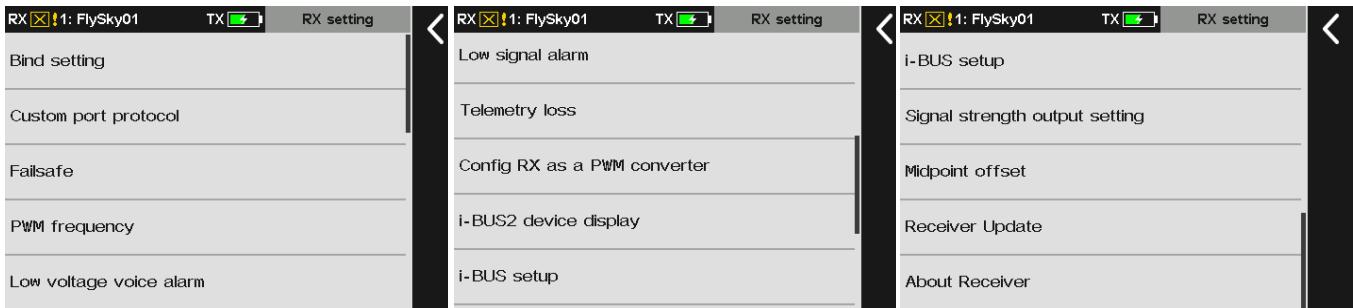

Setup:

Click **RF version**, the related information is displayed.

7.12 RX Setting

Information about receiver functions. It can be used to set various functions before the receiver is ready for work.

7.12.1 Bind Setting

This function is used to adjust the transmitter to the bind state and so as to bind with the receiver.

Refer to 5.2 Binding for detailed bind operations.

7.12.2 Custom Port Protocol

Note: This function is available for version 1.0.45 or later. New items are added to this function for enhanced receivers.

Sets the type of output signal of the receiver connector. This screen shows on the left side the connectors that can be set, and on the right side, the protocols that can be set. Only the enhanced version receiver supports the output of i-BUS2 protocol signals.

Enhanced version receiver: When no receiver is connected, 4 Newport are displayed by default for setting; When a receiver is connected, the Newport that can be set on this receiver are displayed.

Classic version receiver: When no receiver is connected, i-BUS/Servo and CH1 are displayed by default; When a receiver is connected, the connectors that can be set are displayed.

Setup:

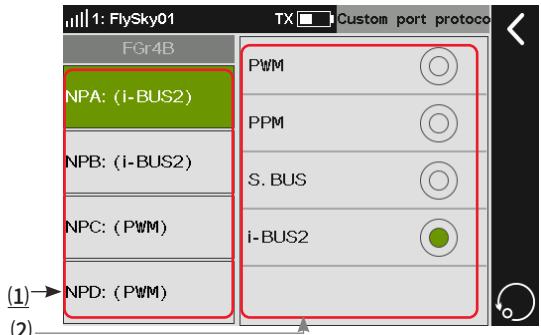

1. Tap **Custom port protocol** to enter the setting interface.
2. Tap the Newport you want to set, e.g. **NPA**. Then click the appropriate protocol.
3. Click **◀** to return to the previous interface.

Note: Neither classic version receiver nor enhanced version receiver supports i-BUS-IN setting in one-way communication. More notes are as below:

Enhanced version receiver:

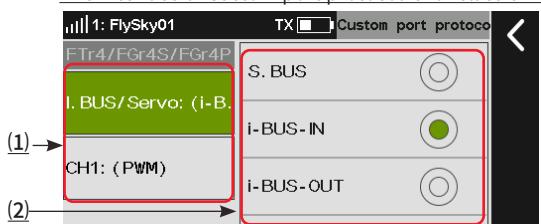

- For double receivers, you can set the type of output signals for the connectors of the primary and secondary receivers separately. However, the secondary receiver does not support external sensors. Therefore, the protocol cannot be set to i-BUS-IN.
- The signal types that can be selected once only in multiple for any Newport: PPM, S.BUS, i-BUS-IN and i-BUS-OUT. If NPA is set as i-BUS-OUT, NPD/NPC/NPB can no longer set to i-BUS-OUT.
- If i-BUS is selected for any Newport, i-BUS2 cannot be selected for

The screen of Custom port protocol is for enhanced RX.

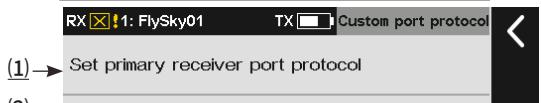

- (1) Tap to select the newport: NPA, NPB, NPC or NPD.
(2) Tap to select the signal type for newport: PWM, PPM, S.NUS, i-BUS-IN, i-BUS-OUT or i-BUS2.

The interface of Custom port protocol is for classic RX.

- (1) Tap to select i-BUS/Servo or CH1.
(2) Tap to select the signal type for i-BUS/Servo or CH1.

The interface is for double receivers are bound.

- (1) Tap to enter the port protocol setting menu for primary RX.
(2) Tap to the port protocol setting menu for secondary RX.

微信公众号

Bilibili

Website

Facebook

any other Newport; If i-BUS2 is selected for any Newport, i-BUS cannot be selected for any other Newport. For i-BUS2 and PWM options, Newport can select them repeatedly.

- If you have bound double receivers, you can set the protocol of the primary and secondary receivers separately.

Classic version receiver:

- For CH1, you can select PPM/PWM only. If the receiver does not support PPM signal output, the setting is invalid.
- For receivers with SENS connectors, i-BUS/Servo does not support i-BUS-IN.

7.12.3 Failsafe

Note: This function has been updated in version 1.0.73 and later.

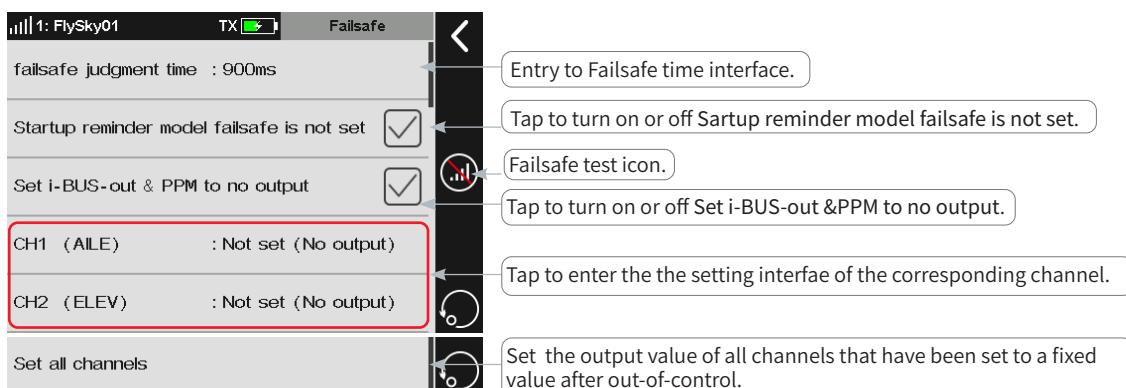

For failsafe, PL18 transmitter provides the following several settings:

- To set failsafe judgment time. The system supports setting the **failsafe judgment time**, and the default judgment time vary with different RC model.
- You can enable/disable the function of **Startup reminder model failsafe is not set**.
- Set to disable the signal output of i-BUS-out and PPM protocol connectors in case of out-of-control, i.e., no output at i-BUS-out & PPM connectors in case of out-of-control. You can set failsafe values channel by channel, there are four modes that can be set, including **Not set (No output)**, **No output** (the settings are only for some special models or some flight control board detection ports), **Fixed value**, and **Hold**.
- To set all channels. With this function, you can set the output value of all channels that have been set to a fixed value after out-of-control.

Setting Recommendations:

- Considering that the aircraft/glider can glide down without power, users can set the throttle to the lowest value or low idle speed, and the rest of the channels to smooth flight (or hovering).
- The helicopter throttle is set to the lowest value, and the rest of the channels is set to smooth flight.
- For multicopter settings, please refer to the relevant manual.
- If the device connected to the receiver has requirements on the failsafe state setting, it can be set as required.

Note. The above suggestions are for reference only. The specific settings are subject to the actual flight conditions.

Failsafe Judgment Time

Used to set the failsafe judgment time, the setting range is from 250ms to 1000ms.

The default judgment time vary with different RC model. For Airplane, Glider, Helicopter and Multicopter, the failsafe judgment time is 700ms by default, and 300ms for Car, Ship, and Robot.

Setup:

1. Tap failsafe judgment time to enter.
2. Click +/- to set the appropriate value, then click to return.

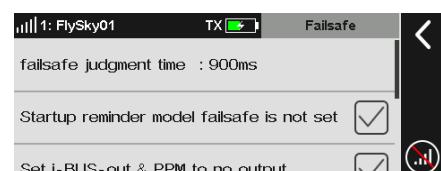

Startup Reminder Model Failsafe Is Not Set

Used to set to check or uncheck the **Startup reminder model failsafe is not set**. Note: If the " Startup reminder failsafe is not set" (System> General) function is checked and all channels are in Not Set (No Output) status, a pop-up window will prompt that failsafe has not been set when the transmitter is turned on.

Setup:

Tap the box next to right of the function, when it is not ticked (, it indicates that the function is disabled.

Failsafe Test Function

Used to simulate the out-of-control case, when the model is out-of-control, the transmitter will shut down the RF, then the RC model will enter the out-of-control status. All channels will output according to failsafe settings.

Setup:

1. Tap , a popup window comes along with it as shown. Press and hold over one second, then the system will turn off RF. And the receiver will output channel value according to failsafe settings.
2. Release , the RF will be on and the connection will be restored.

Bilibili

Website

Facebook

Setting i-BUS-out & PPM to No Output

This function is for i-BUS and PPM signals. After the **Set i-BUS-out & PPM to no output** is enabled, regardless of the setting of the failsafe, these two types of failsafe signals are always no output. If the function is disabled, after losing control, you can set by channel: set to fixed value or keep the last output value. By default, this function is enabled.

Setup:

If the check box next to right of the option is not ticked (✓), it indicates that the function is disabled.

Note: When Set i-BUS-OUT&PPM signal to no output is not checked and the channel is set to no output, the last value is output in case of out-of-control.

Setting A channel

Can be used to set the output signal states of channels 1~18 respectively, the mode includes: **Not set(No output)** means the failsafe of this channel has not been set. **No output** means that there is no output in case of out-of-control; **Hold** means the last channel value is kept in case of out-of-control; **Fixed value** means that you can set the failsafe output value by moving the control, then the value set will output in case of out-of-control.

Setup:

1. Tap to select the channel to be set and enter the next level interface.
2. Tap to select the desired function options. If the fixed value is selected, turn the **Stick**(Switch, Knob or LSW) to the desired position and hold it, then click **◀** to return to finish the settings.

Setting All Fixed Value Channels

Used to set the output value of all channels that have been set to a fixed value after out-of-control.

Setup

1. Tap **Set all channels**, a prompt menu will pop up.
2. Move all controls corresponding to channels with fixed values and hold them if needed.
3. Tap **Yes** to finish.

Note: For the channels controlled by a control, please refer to **FUNC. ASSGN** section for detailed.

7.12.4 PWM Frequency

Note: This function is available for version 1.0.65 or above. New items are added to this function for enhanced version receivers.

The receiver's output frequency of PWM signals can be regulated. Theoretically, the higher the frequency, the faster the signal is refreshed, and the faster the servo responds to the signal change. However, some servos may not support PWM signals with excessively high frequency. You may need to take into account the servo's performance when doing such settings.

The interface of this function may vary with bind modes. For enhanced receivers, the PWM frequency of each channel can be set separately, and the options include analog servo (50 Hz), Digital servo (333 Hz), SR (833 Hz), SFR (1000 Hz) and Custom.

If a classic receiver is bound, all channels are set together, and cannot be set to SR (833 Hz) and SFR (1000 Hz).

PWM Frequency-Enhanced Version Receiver

Sets PWM frequency after the transmitter is bound to enhanced version receivers.

Setting All Channels

Sets PWM frequency for all channels.

Setup:

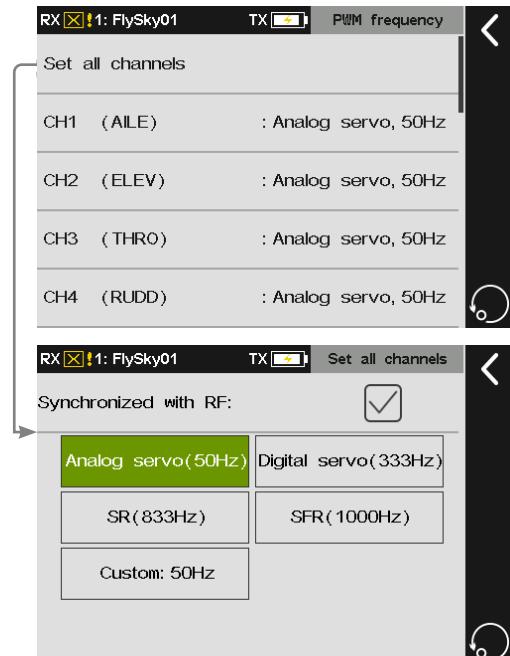

1. Tap Set all channels.
2. Tap the appropriate item according to the actual servo. Then click  to return.
3. For Custom, click + / - to set an appropriate frequency value.
4. For Synchronized with RF, click the check box at the right. "✓" means the function is activated, the PWM output is synchronized with the timing of the (RF) radio signal reception.

Setting A Channel

Sets PWM frequency for a channel.

Refer to the descriptions of Set all channels for Setup.

 ATTENTION	<ul style="list-style-type: none"> When SR (PWM frequency: 833 Hz) and SFR (PWM frequency: 1000 Hz) are selected, the overall system delay will be decreased, but the pulse range of PWM signals is changed. Please make sure the servo supported the corresponding frequency is a digital servo and the setting is correct. Otherwise the servo may not work properly, or even get damaged.
---	---

微信公众号

Bilibili

Website

Facebook

PWM Frequency-Classic Version Receiver

Sets PWM frequency after the transmitter is bound to classic version receivers.

For the setting of PWM frequency, please refer to **Setting All Channels**.

Description on the Duration of PWM Effective Pulse Width

The relevant information is as below, of which such as duration of PWM effective pulse width corresponding to different PWM frequencies.

Item	FREQ	Duration of PWM Effective Pulse Width/ Corresponding Channel Rate		
		Min	Max	Neutral
Analog Servo	50Hz	750us/-150%	2250us/150%	1500us/0%
Digital Servo	333Hz	750us/-150%	2250us/150%	1500us/0%
Custom	50~400Hz	750us/-150%	2250us/150%	1500us/0%
SR	833Hz	425us/-130%	1075us/130%	750us/0%
SFR	1000Hz	125us/-150%	875us/150%	500us/0%

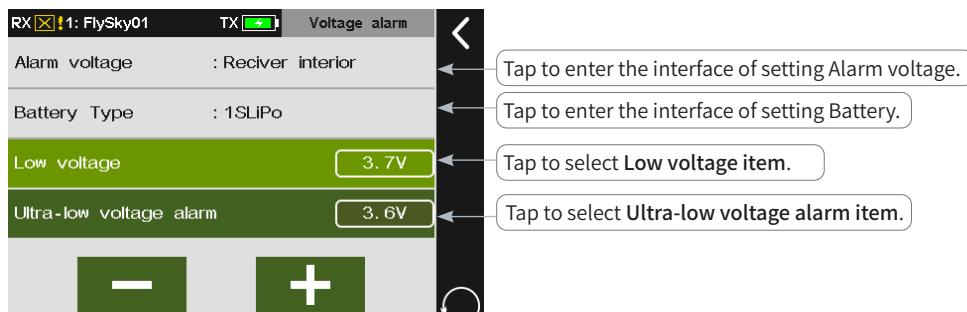

Notes:

1. If the Midpoint offset in the RX setting is set to Offset 1520, the transmitter will offset the channel value 20us and output it.
2. Although the channel range can be set from -150% to 150%, while SR (833Hz) only supports the range of -130%~130%. Namely, when the transmitter channel output is greater than 130% or less than -130%, the receiver will still output 130% or -130%.

7.12.5 Low Voltage Voice Alarm

Set voltage alarm, battery type, low voltage alarm value and ultra-low voltage alarm value. Once it is set, the transmitter will trigger a voice alarm if the battery voltage of the relevant device is lower than the alarm voltage set to alert the user of low voltage or ultra-low voltage.

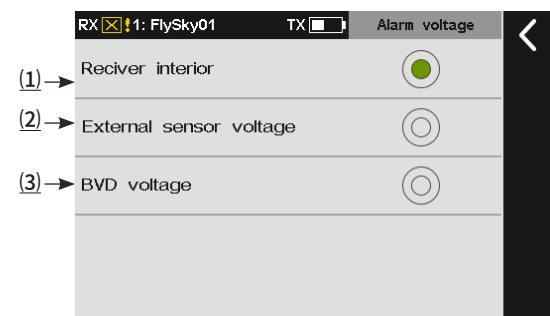

Setup:

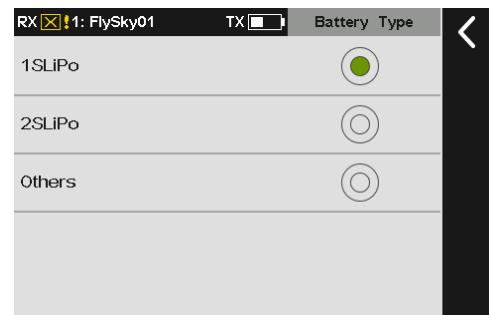

1. Click **Alarm voltage** to enter the next interface.
2. Tap the appropriate item according to you want to set. Then click to return.
3. Tap **Battery Type** to enter the setting interface, then click the appropriate battery type.
4. Click + / - to set an appropriate voltage according to the actual device.

Notes:

1. Please refer to 14.1.3 for turning on or off the voice.
2. When it is set to detect the voltage of external sensors, and the receiver is connected to more than one voltage sensor, only the first voltage sensor connected to the receiver is detected for its voltage.
3. If **BVD voltage** is selected, the receiver needs a BVD interface to detect BVD voltage via BVD detection cable.
4. When double receivers are bound, the receiver voltage alarm is set to the primary receiver.

- (1) Tap to select **Receiver interior**, and to detect the receiver voltage. The alarm is triggered when the detected voltage value is equal to the alarm value.
(2) Tap to select **External sensor voltage**, and to detect the voltage of the external sensor.
(3) Tap to select **BVD voltage**, and to detect BVD voltage.

Facebook

7.12.6 Low Signal Alarm

Note: This function was added in version 1.0.77.

This function is used to set up the alarm feature for signal strength when the transmitter and receiver communicate in two-way mode.

You can set a specific alarm threshold for signal strength, as well as whether to enable repeated alarms and the time interval for repeated alarms; you can also set the type of alarm sound and vibration.

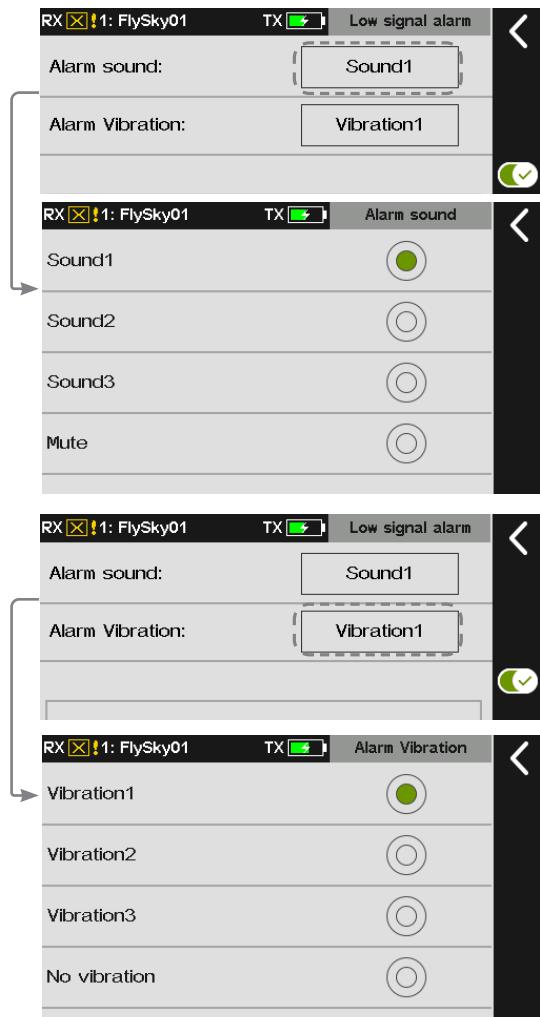

Setup:

1. Set Low signal alarm to enter the setting interface.
2. Set alarm sound:
 - First, tap the function box to the right of "Alarm sound" to enter the alarm sound settings interface; then tap the appropriate option; click to go back.
3. Set alarm vibration:
 - First, tap the function box to the right of "Alarm vibration" to enter the alarm vibration settings interface; then tap the appropriate option; click to go back.
4. Set alarm signal strength value:
 - Tap +/- to adjust the value, and the value is displayed in the function box to the right of "Alarm Value".
5. Set repeat alarm and repetition frequency:
 - Tap the function box to the right of "Repeated"; you can toggle the function item by taping continuously.
6. Turn off alarm function:
 - Tap to the right of the interface, and then change to , which will disable the alarm. The default is to have it enabled.
7. To restore default settings, tap , and then click Yes in the pop-up interface to reset all items on this interface to their default values.

After setting the alarm function, when the receiver's signal strength is lower than the set value, the transmitter's LED will flash and give a low signal alarm according to the set method.

Notes:

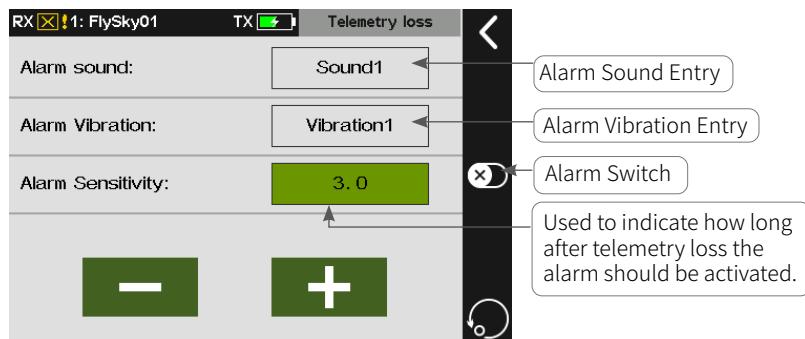

1. If double receivers are bound, when both primary and secondary receivers are connected, the alarm will activate when the primary receiver's signal strength is below the set value; if only the secondary receiver is connected, the alarm will activate when the secondary receiver's signal strength is below the set value.
2. If the alarm sound (General > Sound > Alarm sound) and vibration (General > Vibration) have been turned off, the alarm sound and vibration set here will not trigger any notifications.

7.12.7 Telemetry loss Alarm

Note: This function was added in version 1.0.77.

Used to set up the alarm function for telemetry loss when the transmitter and receiver communicate in two-way mode.

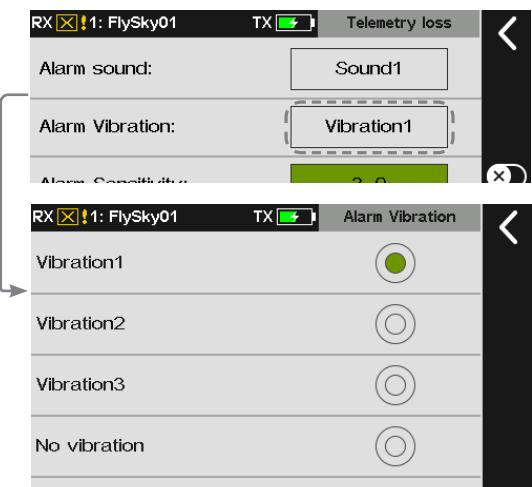

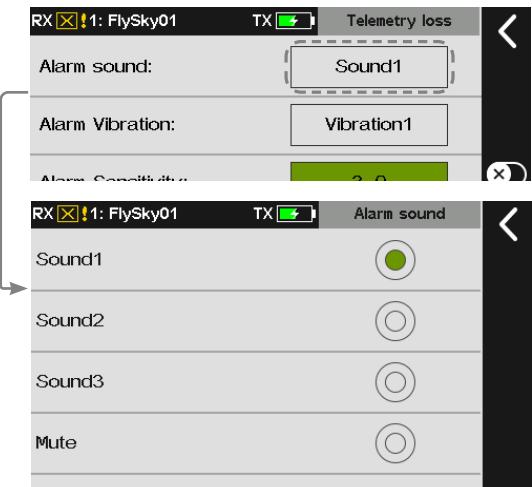

Setup:

1. Set Telemetry loss to enter the setting interface.
2. Set alarm sound:
 - First, tap the function box to the right of "Alarm sound" to enter the alarm sound settings interface; then tap the appropriate option; click to go back.
3. Set alarm vibration:
 - First, tap the function box to the right of "Alarm vibration" to enter the alarm vibration settings interface; then tap the appropriate option; click to go back.
4. Set alarm sensitivity value:
 - Tap +/- to adjust the value, and the value is displayed in the function box to the right of "Alarm Sensitivity".
5. Turn off alarm function:
 - Tap to the right of the interface, and then change to , which will disable the alarm. The default is to have it enabled.
6. To restore default settings, tap , and then click Yes in the pop-up interface to reset all items on this interface to their default values.

After setting the alarm function, when the receiver's telemetry loss time exceeds the set duration, the transmitter's LED will flash and give an alarm according to the configured alarm method.

Notes:

1. If double receivers are bound, the system will only activate the alarm when both the primary and secondary receivers lose their signal connection, i.e., when they both disconnect.
2. If the alarm sound (General > Sound > Alarm sound) and vibration (General > Vibration) have been turned off, the alarm sound and vibration set here will not trigger any notifications.

微信公众号

Bilibili

Website

Facebook

7.12.8 BVD Voltage Calibration

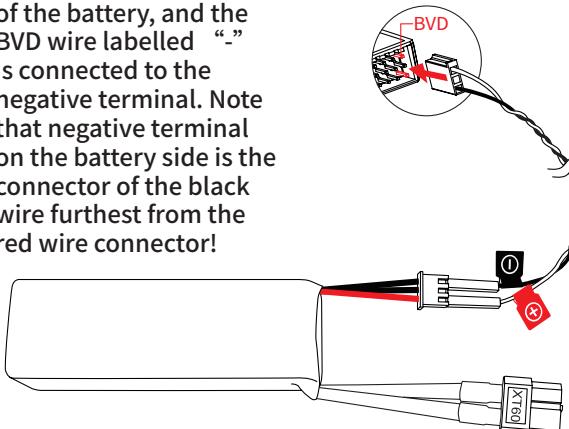

There may be a voltage difference between the voltage detected by the receiver and the actual voltage of the battery. Use this function to set a calibration coefficient for the receiver to make the voltage displayed on the interface is equal to the battery voltage, namely, the sum of the detection voltage and the calibration coefficient is equal to the voltage displayed on the interface.

The BVD voltage detection range is from 0 to 70V.

Notes:

1. This function is applicable to enhanced version receivers with BVD function, must be in two-way communication with the transmitter.
2. Pay attention to correctly connecting the BVD cable and the anode and cathode of the battery as shown in right diagram.

! Make sure the BVD wire labelled "+" is connected to the positive terminal of the battery, and the BVD wire labelled "-" is connected to the negative terminal. Note that negative terminal on the battery side is the connector of the black wire furthest from the red wire connector!

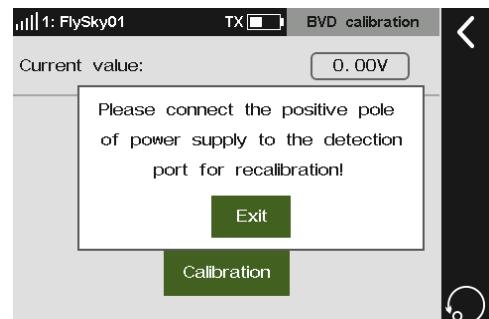

Setup:

1. Make sure the transmitter and receiver are bound; Connect the BVD harness to the receiver's BVD interface. Make sure the positive and negative terminals are connected to the positive and negative poles of the battery.
2. Tap **BVD Voltage Calibration** to enter calibration screen.
3. Click +/- to tune to the measured voltage of the battery.
4. Click **Calibrate** to calculate the calibration factor by the current value and the sensor measured value, and the result will be sent to the receiver to calibrate the BVD detection function.

Notes:

1. This function calibrates the BVD voltage of primary receiver. To calibrate the secondary receiver (double receivers), you have to calibrate the BVD voltage of this secondary receiver-to-be before you bind it to the transmitter.
2. Make sure the battery is properly connected during calibration. To ensure accurate calibration, the Current Value, in calibration, needs to be set to the battery's measured voltage value. Recalibrate if necessary.

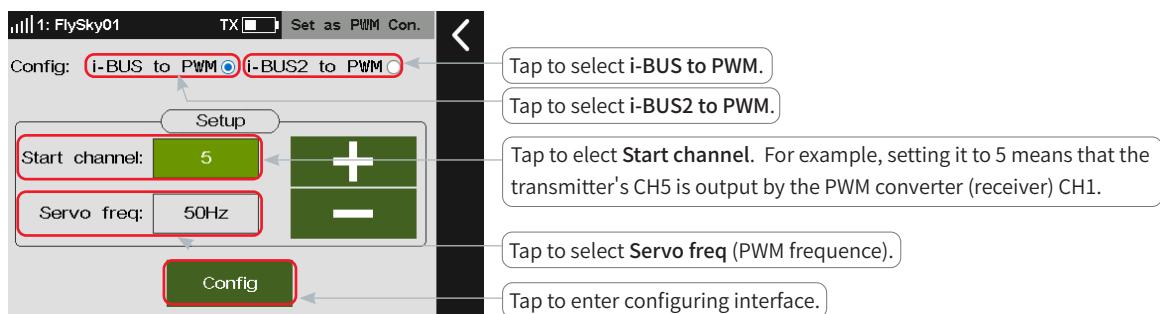

7.12.9 Config RX As A PWM Converter

Note: This function is not available for all receivers. For the classic receiver, only is available for the FGr4 and FTr10 receivers.

For the classic version receivers, If set as a PWM converter through the i-BUS to PWMsetting, its SENS connector should be connected to the receiver's i-BUS-OUT connector; If set as a PWM converter through the i-BUS2 to PWMsetting, its SENS connector should be connected to the receiver's i-BUS2 connector.

For the enhanced version receiver, If set as a PWM converter through thei-BUS to PWMsetting, its NPA connector should be connected to the receiver's i-BUS-OUT connector; If set as a PWM converter through thei-BUS2 to PWM setting, its NPA connector should be connected to the receiver's i-BUS2 connector.

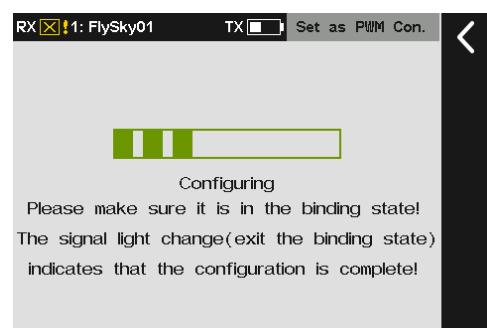

The receiver set as the PWM converter can be converted into a receiver by rebinding the transmitter, and then used normally as a receiver after successfully rebinding the transmitter.

Setup:

1. Enter the interface of **Config RX as a PWM converter**.
2. Tap **Start channel** or **Servo freq**, then click + / - to set an appropriate value. Then click **Config**, the configuring interface comes along.
3. Put the receiver to enter the bind mode, after the LED status of the receiver changes from fast flash to slow flash, it indicates the configuration is finished. Then click **◀** to return.

If you set the receiver as a i-BUS2 PWM converter, there are not **Start channel** and **Servo freq** function items. After the receiver is set as a i-BUS2 PWM converter, you can set the related parameters via **i-BUS2-PWM Converter Setting** function

7.12.10 i-BUS2 Device Display

Note: The i-BUS2 Sensor Preview is added for 1.0.70 or later.

To preview the i-BUS2 device detected by the transmitter to check whether each i-BUS2 device is connected properly. The displayed information varies with devices. For example,

- for the PWM converter, **Device List** displays the converter name, and **Device Information** displays the device name and the number of interfaces.
- For the HUB device, **Device List** displays the device name and the name of i-BUS2 device connected to the interface of the converter, and **Device Information** displays the device name and sensor ID.
- For the GPS device, **Device List** displays the device name, and **Device Information** displays the device name and sensor ID.
- For i-BUS2 sensor, **Device List** displays the interfaces and type, and **Device Information** displays the type and number of the sensors.

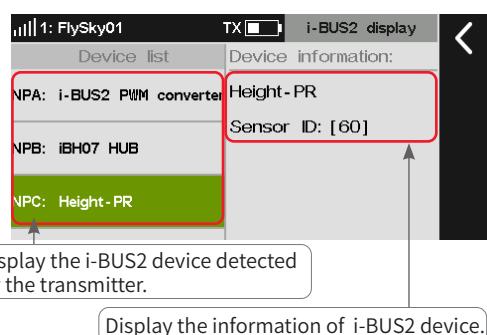

Setup:

Tap **i-BUS2 device display** to view the related information.

Notes:

1. This screen displays only the i-BUS2 device identified by the transmitter. The i-BUS2 device shall be properly connected to the interface of which the receiver is set as i-BUS2 protocol.
2. The i-BUS2 signal only supports the secondary expansion.
 - When the receiver has only one interface set as i-BUS2 protocol, the i-BUS2 HUB output port connected to this interface can be connected to i-BUS2 HUB again. This HUB interface can still output i-BUS2 signal and can be connected to the i-BUS2 device.
 - When the receiver has two or more interfaces set as i-BUS2, the signal has been extended once by the receiver, so that i-BUS2 HUB output port accessed by the interface at this time can no longer be connected to the HUB, but can be connected to other i-BUS2 devices for use.

7.12.11 i-BUS2 RPM Sensor

Note: This function is available for version 1.0.70 or later.

When the transmitter detects the i-BUS2 RPM sensor, the

interface is displayed. At this time, you can set the number of propellers of the i-BUS2 RPM sensor.

Setup:

1. Tap **i-BUS2 RPM** to enter.
2. Click + / - to set an appropriate value of propeller, Then click **◀** to return.

Note: The number of propeller can be set from 1 to 12.

7.12.12 Setting i-BUS2 HUB As A PWM Converter

When the transmitter detects the i-BUS2 HUB device, this setting interface is displayed. The i-BUS2 HUB device can be set as the PWM converter, and the same function as the receiver being set as PWM converter for use.

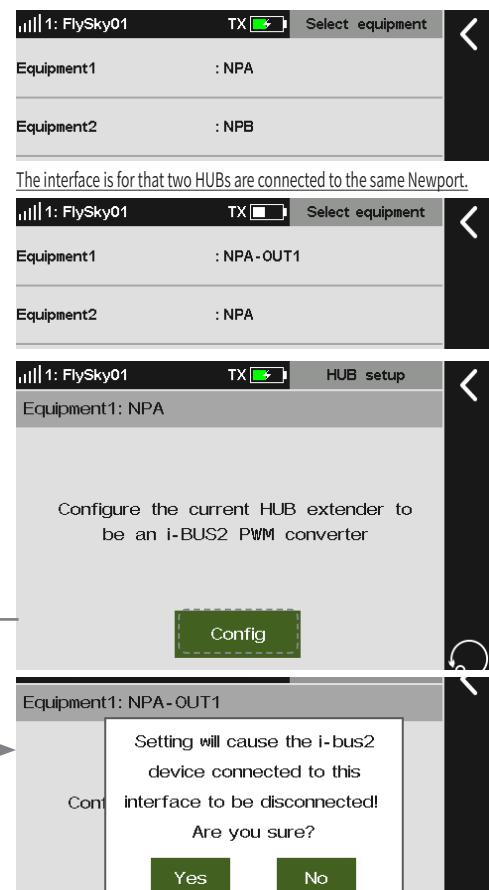

Note: This function is only available for HUB FS-iBH07.

Setup:

1. Tap Set i-BUS2 HUB as a PWM converter to enter.
2. Tap the device you want to set if there are more than one device to enter, then click Yes on the pop-up screen after clicking Config to finish.

Notes:

1. This function is only available when such i-BUS2 devices are connected. If only one such device is connected, the Select equipment(Device) screen is skipped.
2. i-BUS2 HUB device connects to any of the NPA~NPD interfaces of the enhanced receiver (custom interface protocol is set to i-BUS2) so as to establish a connection with the transmitter.
3. If the i-BUS2 device interface has already connected to another device, the i-BUS2 HUB disconnects with the devices previously connected after setting as a PWM converter.

7.12.13 i-BUS2 PWM Converter Setting

Set the i-BUS2 protocol converter function. You can set the converter to HUB, PWM frequency of the converter interface, and the output signal channel of the converter interface.

Note: This function item is only available when such i-BUS2 devices are connected. If only one such device is connected, the Select Device screen is skipped.

微信公众号

Website

Facebook

Setting as i-BUS2 HUB

To set the i-BUS2 device that has been configured as a PWM converter back to the i-BUS2 HUB.

Setup:

Tap **Set as i-BUS2 Device** to back to the i-BUS2 HUB.

Note: If the converter is configured for the receiver, it prompts setting failure. The receiver is not supported to be used as HUB.

Keeping up With Channel PWM Frequency

To set the output PWM signal frequency of the converter interface.

Setup:

Tap **Keep up the channel PWM frequency**. A pop-up screen appears, and there will be a reminder when it is completed.

Setting The Channel of The Output

To set the channel of converter output interface.

Setup:

1. Tap the channel you want to set.
2. Tap an appropriate item. Then click  to return.

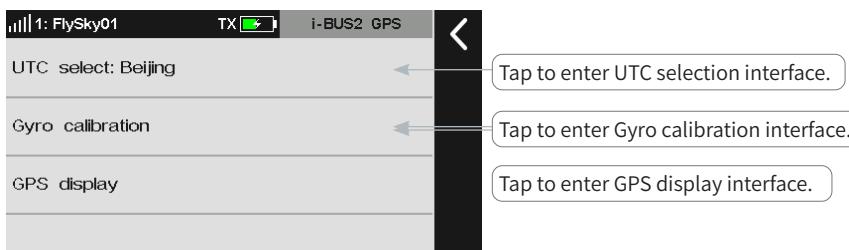

7.12.14 i-BUS2 GPS Sensor Setting

Note: This function is available for version 1.0.65 or above.

This function is applicable to GPS module of i-BUS2 protocol. Through this function, you can set the standard time zone, perform gyroscope level calibration, and view GPS parameter display interface to get relevant information.

Note: This function is only available when such i-BUS2 devices are connected. If only one such device is connected, the Select Device screen will be skipped.

UTC Selecting

To set UTC.

Setup:

1. Tap **UTC select** to enter.
2. Tap an appropriate time zone. Then click  to return.

Gyroscope Calibration

Calibrate the gyroscope. Before calibration, please connect the GPS sensor to the device correctly and make sure the device is placed horizontally.

Setup:

1. Tap **Gyro calibration** to enter.
2. Tap **Calibration**. The system will calibrate automatically.
3. When calibration succeeds or fails, the system displays a pop-up screen indicating the success or failure of calibration. Click **Exit** on the prompt screen to return to the previous screen.

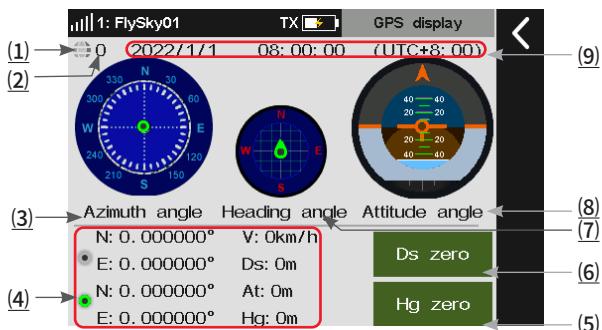

GPS Display

To display the information returned by the GPS sensor.

Setup:

Tap **GPS display** to enter, then you can view the related information. Click **<** to return.

(1) To show whether the positioning is successful or not. If the icon is blue indicating the positioning is successful, the icon is gray, then the positioning is failure.

(2) the number of satellites returned by the GPS module.

(3) Azimuth angle: Refers to the orientation of the aircraft from the zeroing point. The green dot that moves on the dial marks the current orientation of the aircraft from the starting point. The center of the azimuth angle indicates the starting point. By default, the starting point is the power-on position.

(4) The information of latitude and longitude, distance, height, altitude and speed is displayed. Above is latitude and longitude of a position point when the distance is zeroed, and below is the real-time latitude and longitude of a position where the aircraft is in. Speed refers to the speed of the aircraft relative to the ground. Height refers to the height of the aircraft relative to the ground. Distance refers to the distance of the current position of the aircraft relative to the starting position.

(5) Hg zero: Tap to clear the height value.

(6) DS zero: Tap to clear the distance value.

(7) Heading angle: Used to indicate the real time heading angle of the aircraft during the flight.

(8) Attitude angle: The center of the circle moves up and down to indicate the pitch angle of aircraft. Outer circle rotates to indicate the roll angle of aircraft.

(9) Displays the date and time, with the date in year/month/day and the time in 24-hour format.

7.12.15 i-BUS2 Current and Voltage Sensor Setting

When the transmitter detects an i-BUS2 voltage and current sensor, this feature item is displayed. It is used for resetting and calibrating the current and voltage sensor information.

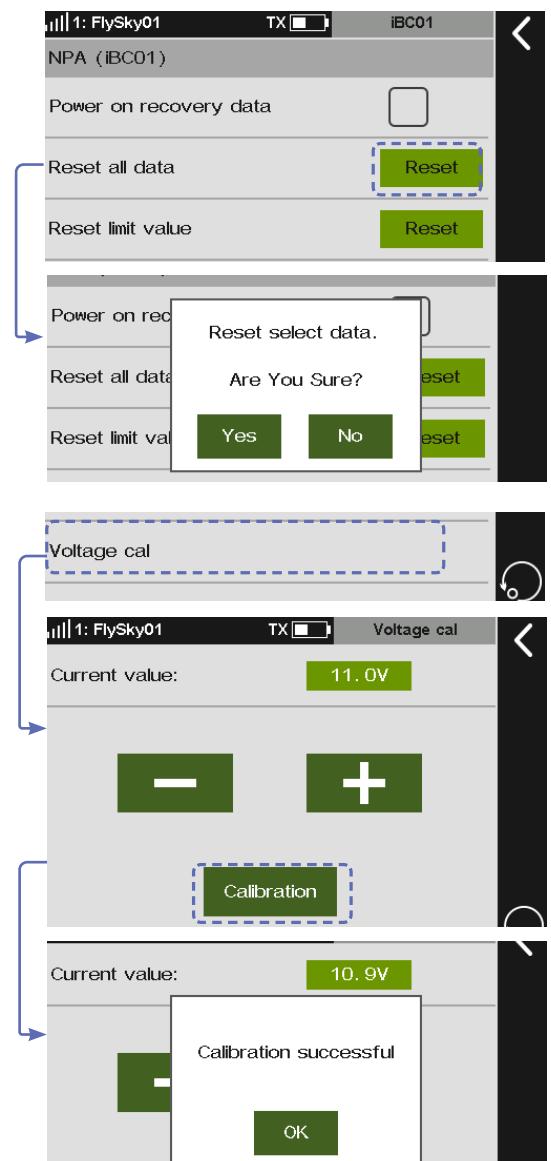

Warning	• Make sure to refer to the "Installation and Cable Connecting" section of the FS-iBC01 user manual for correct wiring. Otherwise, there may be an explosion or fire.
----------------	---

Note: Please refer to the voltage value measured by the multimeter for calibration.

Setup:

1. Tap Current and voltage sensors settings to enter the function interface.
2. If you want to prevent recorded data from being automatically cleared after powering on,
 - Tap the box to the right of the function, if it is not checked, the data will not be cleared.
3. If you want to reset all data;
 - Tap Reset all data, and then click Yes in the pop-up interface to complete.
4. If you want to reset extreme value data,
 - Tap Reset limit value data, and then click Yes in the pop-up interface to complete.
5. Voltage calibration,
 - Note that before calibration, connect the sensor's detection line correctly to the device to be tested. Click on Voltage cal to enter the calibration interface; click +/- to adjust to the actual measured voltage of the battery; click Calibration, the system prompts that the calibration is successful, click OK to complete.

7.12.16 i-BUS Setting

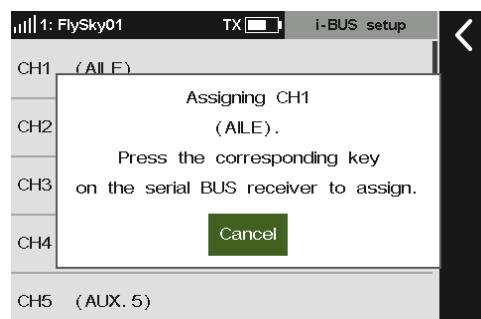

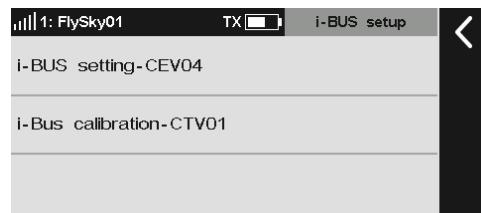

This function is used to set the external device with supporting i-BUS protocol, and the Serial Bus Receiver and Voltage sensor can be compatible with it currently.

Serial Bus Receiver FS-CEV04 Setting

After the setting is completed, FS-CEV04 can convert i-BUS signal to PWM signal and output PWM signal.

Setup:

1. Make sure the transmitter and the receiver are bound.
2. Connect the FS-CEV04 to the SERVO port on the receiver.
3. Connect a servo to one of the C1-C4 ports of the FS-CEV04.
4. Power on the transmitter and navigate to the **i-BUS setup** function item located in the **RX setting** function. Select the channel you want to assign. If clicking a wrong channel, then click **Cancel** to cancel it.
 - The system pops up a pop-up window "Press the corresponding key on the serial bus receiver to assign".
5. Press the corresponding button. After the channel assignment is successful, a pop-up window will appear.
 - If the channel assignment is successful, channel number and interface number will be displayed.
6. Repeat the steps above for setting more channels.
 - If there are too many peripherals attached to the i-BUS serial bus receiver, power it separately.

FS-CVT01 Voltage Sensor Calibrating

Note: This function is available for version 1.0.65 or above.

A calibration factor can be set to correct the voltage value returned by the i-BUS voltage sensor FS-CVT01. The calibration factor is stored in the transmitter and shall be recalibrated when the battery type is changed.

Refer to 7.9 Sensor FS-CVT01 for the description of Setup.

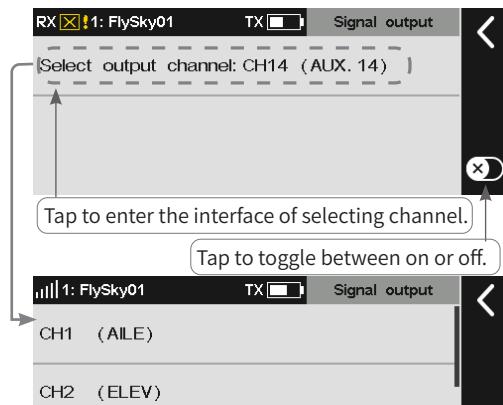

Note: During the calibration, the voltage sensor must be connected to a power supply.

7.12.17 Signal Strength Output Setting

Through this function, you can select a channel to output the signal strength value of the receiver. After the function is enabled, the selected channel does not perform the output of transmitter's corresponding channel function, but outputs the receiver's signal strength value. This function is necessary for users who use FPV glasses in the operations of traversers. We recommend you to select the CH14 or any auxiliary channel. You can make corresponding adaptations in the flight control settings to view the signal strength information on FPV glasses.

Setup:

1. Tap **Select output channel**.
2. Tap an appropriate channel. And it will automatically return.

微信公众号

Bilibili

Website

Facebook

7.12.18 Midpoint Offset

This is designed for some servos with a midpoint value identified as 1520. Usually, the transmitter assigns the channel midpoint value of 1500 to the receiver. After the selection of offset, the transmitter will output the channel value to the servo by superimposing 20. When you use standard S.BUS protocol devices such as Vbar gyroscope flight control, this function can be set as Offset to achieve the midpoint offset for all channels.

Setup:

1. Tap **Midpoint offset**.
2. Tap an appropriate channel. Click  to return.

7.12.19 Receiver Update

To update the firmware of the receiver. PL18 transmitter packs the firmware of FTr10, FTr16s and etc.. The packed firmware varies with different version firmware. If the receiver does not adapt the transmitter or unexpected error occurs, then upgrade the receiver's firmware. It can also be updated via FlyskyAssistant. Please note that this function is applicable for the FlyskyAssistant firmware version 3.0 or later, and meanwhile, the transmitter with firmware version is 1.0.55 or later.

Setup:

1. The transmitter and the receiver has bound normally.
2. Tap **Receiver Update** to enter and select the receiver you want to update.
3. Click **Update**, then click **Yes** in the pop-up window to put the receiver into updating mode.
4. After the updating is completed, it is will automatically return the previous interface.

Note: If the receiver firmware is the latest version, the system will display a prompted reminder and no need to update.

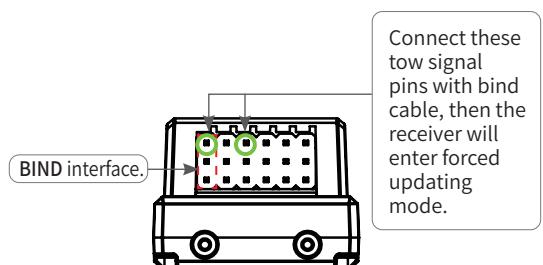

- If the transmitter is unable to bind with the receiver after its firmware is updated, it is required to forced update the firmware of the receiver.

To put the receiver into forced updating mode first, then follow the steps above to update.

The methods of entering forced mode varied with the models, refer to the manual of the receiver for the detailed.

Take FTr10 receiver as an example to show how put it into forced updating mode. Connect the bind cable to the signnal pin of the **BIND** and the other signnal pin shown in the picture, then power on the receiver.

7.12.20 About Receiver

To view the information of the receiver connected.

Setup:

Tap **About receiver** and view the information.

Note: If the double receivers are connected to the transmitter, the information on Primary receiver is displayed.

7.13 THR. Pos. Alarm

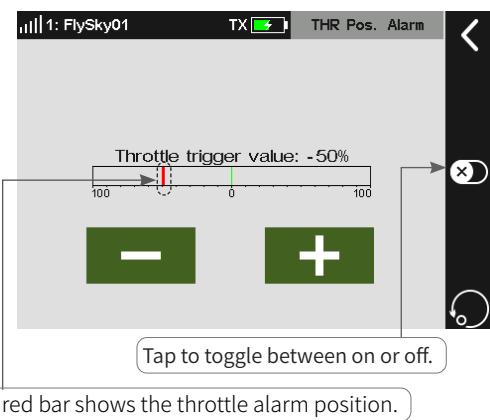

Note: This function has been added in version 1.0.73 and later.

This function is used to monitor the throttle position. The alarm position and alarm on state can be set. When the throttle stick crosses the set position, the system will beep for prompt.

Setup:

1. Tap THR. Pos. Alarm.
2. Click + / - to set an appropriate value. Then click to return.

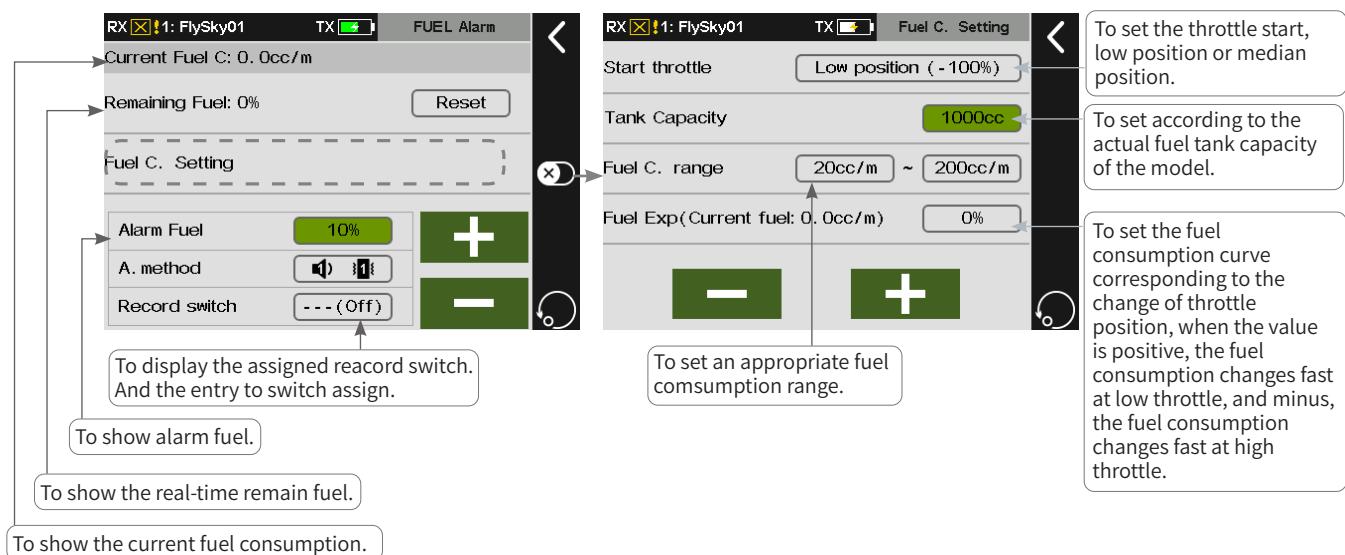

Note: If the system sound and alarm sound are turned off (General>Sound>System sound/Alarm sound), the alarm will not on even if the alarm is enabled here.

7.14 FUEL Alarm

Note: This function has been added in version 1.0.73 and later.

This function is used to monitor the real-time fuel consumption. The rate between the throttle movement and fuel consumption can be set based on your experience. The system can make fuel consumption alarm and fuel consumption display by monitoring the throttle stick position. When the function is enabled, fuel icon (/) will display in status bar at the top of home screen.

微信公众号

Bilibili

Website

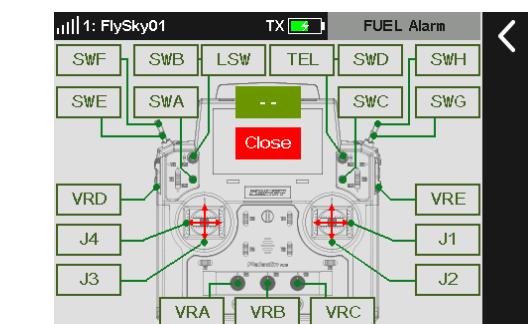

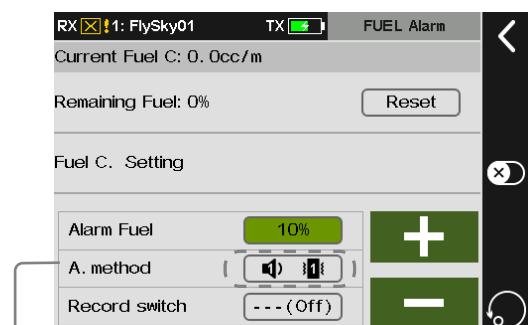

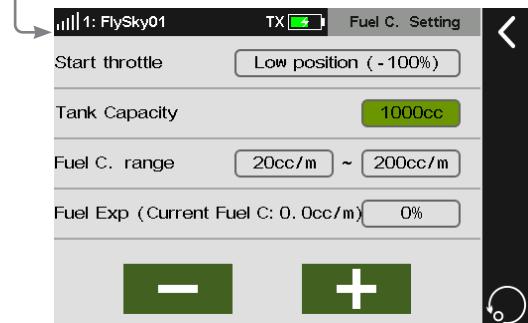

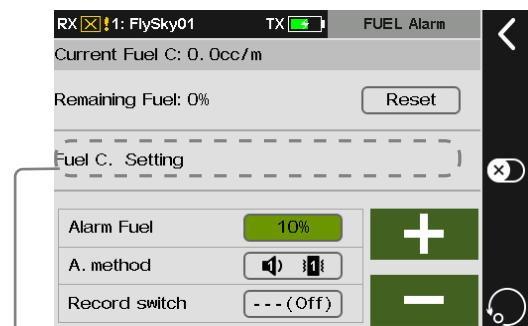

Facebook

Setup:

1. Tap **FUEL Alarm** to enter.
2. To restart the remaining fuel count, click **Reset**.
3. To set the fuel consumption calculation parameters, tap the box to the right side of **Fuel C. Setting** to enter.
 - Tap the box to the right side of **Start throttle** to set the appropriate start.
 - Tap the box to the right side of **Tank capacity** firstly, then click **+ / -** to set an appropriate capacity.
 - Tap the box to the right side of **Fuel C. range** firstly, then click **+ / -** to set an appropriate range.
 - Tap the box to the right side of **Fuel Exp** firstly, then click **+ / -** to set an appropriate rate.
4. Tap the box to the right side of **Alarm Fuel**, then Click **+ / -** to set an appropriate fuel value.
5. To set Alarm method, tap the box to the right side of **A. method** to enter.
 - Tap the appropriate function item for sound or vibration, then click **×** to return.
6. To set record switch, tap the box to the right side of **Record switch**.
 - Tap the control on the interface or toggle the control on the transmitter to select it. Then click **×** to return.

Notes:

1. If the system sound and alarm sound are turned off (General>Sound>System sound/Alarm sound), the alarm will not on even if the alarm is enabled here.
2. The fuel consumption icon in the status bar at the top of the Home1/Home2 is red, indicating that the current remaining fuel has reached the set alarm fuel value.
3. If the record switch is set to Off, then the fuel consumption icon will not show in the status bar at the top of the Home1/Home2. And fuel consumption calculation is paused and there is no alarm prompt.

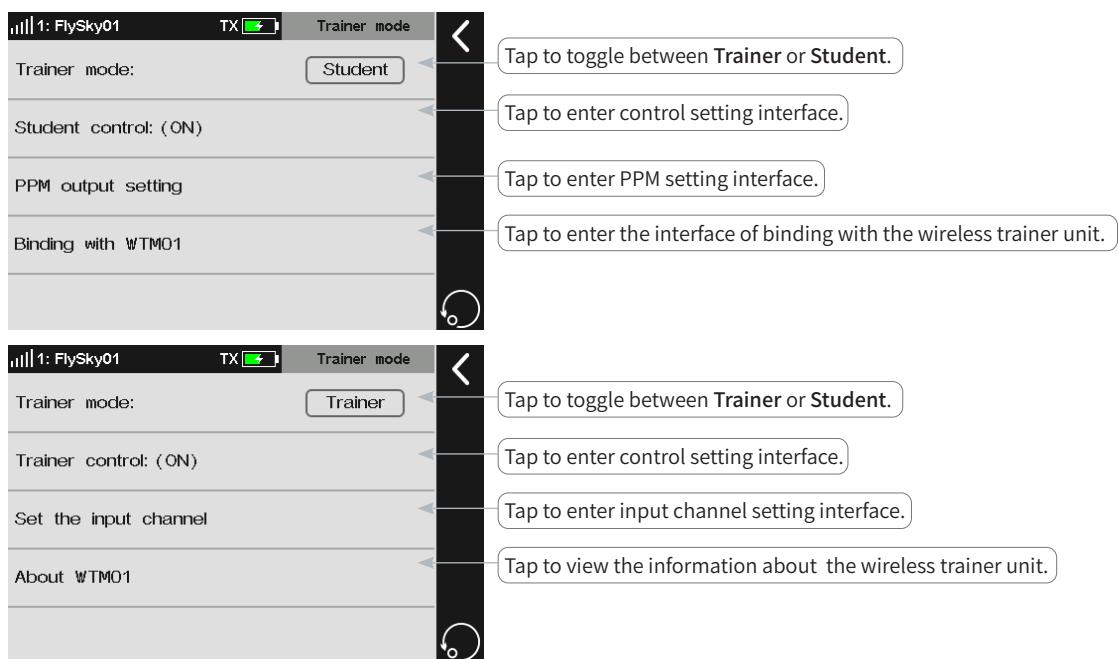

7.15 Trainer Mode

Note: This function is applicable for version 1.0.65 or later.

PL18 transmitter supports two function modes: **Trainer** and **Student**. The transmitter set as trainer mode receives the external signal control model, namely the trainer port has the ability to recognize the external PPM signal input as well as the normally connected wireless trainer unit. The transmitter set as student mode only outputs the PPM signal rather than input signal or connected wireless trainer unit. Two transmitters (one in trainer mode and the other in student mode) can be connected through the trainer cable or the wireless trainer, the two connection methods can be used simultaneously.

Notes:

1. Please verify that the servo surface feedback and motor feedback are normal on the ground before flight.
2. If the two transmitters are connected through the trainer cable, please make sure that the trainer cable is connected correctly. If the two transmitters are connected through the wireless trainer unit, please make sure that the wireless trainer unit is connected correctly in normal communication.
3. The PL18 transmitter's trainer port can be adaptive to recognize the input PPM signal. Most of the devices supporting PPM output can be used as the external input signal source of trainer mode. However, some devices may not support this function. The PPM output of the trainer port can be set to match external devices with special PPM signal recognition requirements.

7.15.1 Student Mode

When the trainer mode is set as student, the transmitter supports only functions of student mode at this time.

Now trainer function applications can be realized through matching with trainer mode of transmitter by setting the student control switch, setting PPM output of trainer port, and binding wireless trainer function.

Trainer Mode

To switch between the **Trainer mode** and the **Student mode**.

Setup:

Click **Trainer Mode** repeatedly to switch between **Tainer** or **Student**.

微信公众号

Bilibili

Website

Facebook

Student Control

Perform the switching to indicate whether the student accepts the control or not. Normally, this switch state is effective when **Trainer control** of trainer mode is disabled.

Setup:

Click **Student control** to enter the switch assignment menu and set the appropriate button. Refer to Chapter 16 in this manual.

Note: Under normal circumstances, make sure that the student control switch is enabled. In this case, the student signal can be sent to the trainer transmitter. Usually, the switch can be set to "--" and normally ON. Please refer to chapter 16 for the switch setting. When the trainer uses the student mode to remotely assist the student to practice, the control authority can only be switched through this switch if the control authority needs to be switched. For details of application scenarios, see the later section.

PPM Output Setting

Set the type of PPM signal output from the trainer port, such as **signal polarity**, **Number of channels**, **Period** and **Starting level**.

Refer to **RF setting** section for the description of Setup.

Binding With FS-WTM01

Bind the transmitter with the wireless trainer module.

Setup:

1. Tap **Binding with WTM01** to put the transmitter into binding mode.
2. Power on the wireless trainer unit and it will enter binding mode. The LED of the wireless trainer unit is solid on after the binding is successful.

Notes:

1. After the model is switched, the wireless trainer unit shall be rebound. The receiver bound in the previous model shall be rebound next time.
2. In the binding, make sure that the working mode of wireless trainer module is matched. For details, see the manual.

7.15.2 Trainer Mode

When the trainer mode is set as trainer, it means that the transmitter only supports the functions of trainer mode. At this time, you can set the matched student mode of transmitter through the trainer control switch and input channel to realize the application of trainer transmitter function.

Trainer Mode

Switching between trainer mode and student mode. By default, it sets to student mode.

Setup:

Click **Trainer Mode** to switch between Trainer and Student.

Trainer Control

The trainer control switch must be **OFF** before the external signals can be used to control the model.

Note: Under normal circumstances, the trainer uses the trainer mode to teach remotely. If you want to use the student mode to teach remotely, the trainer mode control switch must be OFF.

Setup:

Tap **Trainer control** to enter the switch assignment menu and set the appropriate button. Refer to Chapter 16 in this manual.

Set The Input Channel

To assign the functions of the control models corresponding to channel signals of the student transmitter.

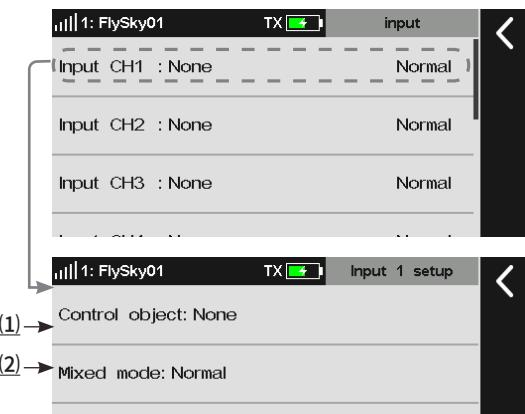

Setup:

1. Tap input **CH1-CH18** channels to enter the corresponding setting screen.
2. Tap **Control object** to enter the control object setting screen.
 - Tap **Stick or Knob** to enter the control object setting screen and select the appropriate stick or knob.
 - Tap **Basic Function** to enter the setting screen, and select the appropriate function item. This item is only available for aircraft models.
 - Tap **Output Channel** to enter the setting screen. Select the appropriate function item.
3. Tap **Mix mode** to enter the setting screen. Select **Normal** or **Mixed**.

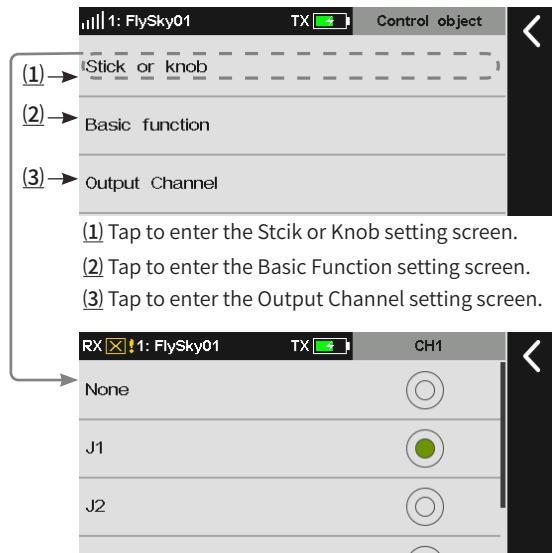

Normal means the student transmitter will control the aircraft model completely. **Mixed** means that the signals of student transmitter and trainer transmitter are superimposed and output. Pay attention to make sure the control is in neutral position for the transmitter which is not involved in control.

Notes:

1. If the stick/knob is selected as the control object, the external input signal will be applied as the stick/knob volume for the function of controlling channel change. For example, when Stick/Knob is set to J3, the transmitter with student mode can control the corresponding function if J3 is functionally assigned with throttle for the transmitter with trainer mode, or J3 is assigned as a control in the Butterfly function.
2. If the control object is assigned as a function, the external input can be involved in the operation as the function master control.
3. If the control object is assigned as a channel, the external input signal is used as the channel volume. At this time, the mix control function and trimming function of the trainer mode of transmitter will be invalid.

- (1) Tap to enter the Control object setting screen.
 (2) Tap to enter the Mixed Mode setting screen.

- (1) Tap to enter the Stick or Knob setting screen.
 (2) Tap to enter the Basic Function setting screen.
 (3) Tap to enter the Output Channel setting screen.

About FS-WTM01

Used to view the information of the wireless trainer unit which is connected with the transmitter.

Setup:

Click **About WTM01** to view the information.

Bilibili

Website

Facebook

Description of trainer coaching

1. This transmitter can be set to student mode. At this time, when a switch can be assigned to control whether the student control signal is sent to the trainer mode of transmitter, and the trainer mode of transmitter can automatically switch to trainer control according to the abnormality (loss) of the student RF signal.
2. According to the above principles, when the trainer coaching is needed in the training, students can set their transmitters as trainer mode and assign the corresponding channels of trainer control signals. The trainer control switch is kept normally OFF. The trainer sets his own transmitter as student mode and meanwhile assigns a student control switch.
3. During use, the trainer sets the student control switch to OFF by toggle switch. At this time, the student can concentrate on practicing with his own aircraft, and the trainer can observe aside and switch to take over the control when he confirms that the student needs help.

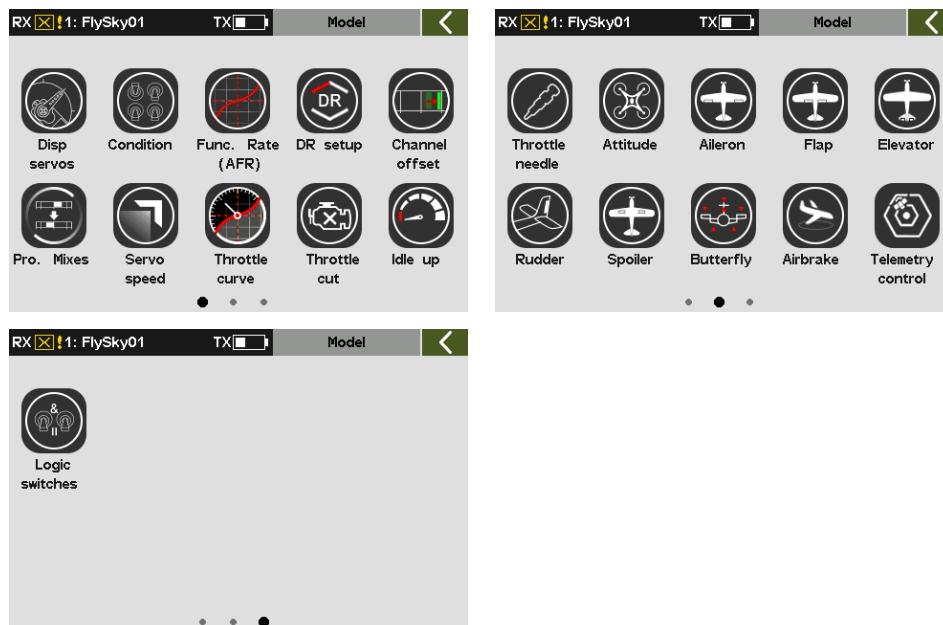

Note: This mode is applicable to only PL18 transmitter with firmware version 1.0.65 or later.

8. Airplane/Glider Exclusive Function Setting

This chapter introduces the function settings of Airplane/Gilder mainly in default condition. After you can set the related model parameters via **Basic > Models**, then you can access **Model** to set the related functions of model via **Home1 > Model**.

Note: the function interface may different based on different model configurations.

微信公众号

Bilibili

Website

Facebook

8.1 Display Servos

Please refer to **7.1 Display Servos** for this function.

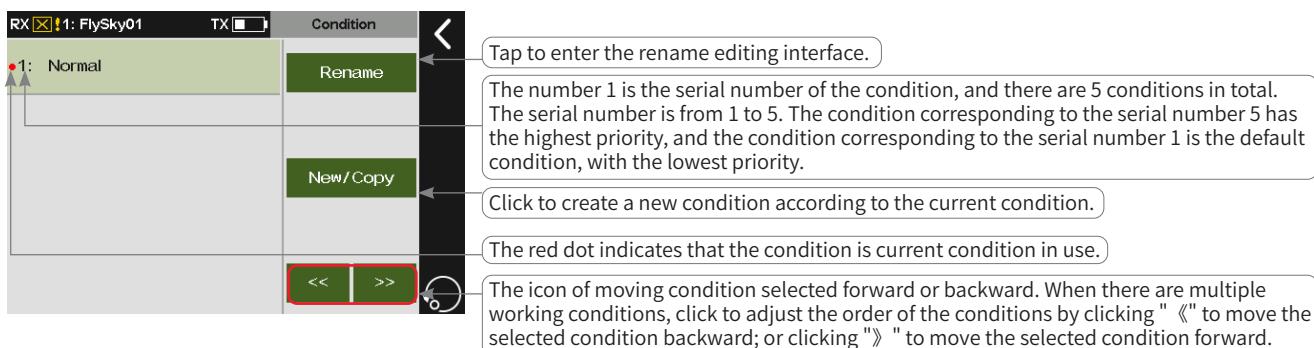

8.2 Condition

Note: This function is updated for version 1.0.70 or later.

You can set the condition selection mode. If you need to achieve different control effects through the switch or stick position, you can set this function. If you do not need to set this function, the transmitter will work in the default condition 1. Users can add a new condition in duplicate as needed. The system supports 5 conditions, and in addition to the default condition, all other conditions need to be assigned with a control (switch/stick, etc.). Conditions are switched through the control. The later ones have higher priority. The default condition will take effect when all the newly created conditions are off. The current condition can be determined by viewing the condition icon displayed on the main interface or the interfaces related to condition settings.

Note: Different parameters can be set for multiple functions of this transmitter by switching different conditions, to perform control operations in different conditions according to different setting parameters. The details are as follows:

1. For Func. assign, different assignments of control and trim can be set for different conditions, or the same for all conditions.
2. For digital trim (TR1~TR8) of Trim, different trim values can be set for different conditions or the same for all conditions.
3. For DR setting, the effective condition can be selected (multiple choices). The DR effectiveness of switching in different conditions may be different.
4. Other items related to the condition can be set separately by switching different conditions, and the channel operation can be executed according to this condition. Usually, the serial numbers and names of the current condition are displayed at the top of these function interfaces. These setting items are contained in the following function interfaces: Func. assign, Channel offset, Pro.Mixes, Servo speed, Throttle curve, Aileron, Flap, Airbrake, Elevator, Spoiler, Butterfly, V Tail, Pitch curve, Thro mixed, Swashplate ring, Hover adjust, Gyroscrop, Governor.

8.2.1 Rename

To rename the condition selected.

Setup:

Tap **Rename** to enter editing interface.

Tap the characters that you want to use, afterwards click

Enter to confirm. The system supports up to ten characters.

Then click **<** to return.

8.2.2 Set Switch

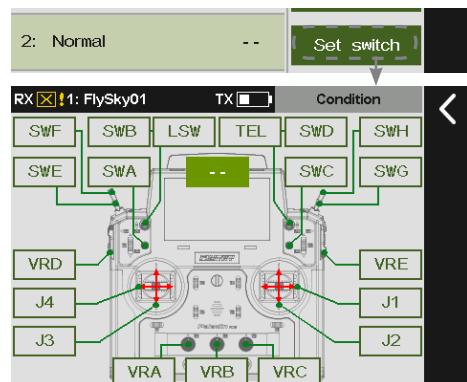

To set a switch to switch among the conditions.

Setup:

Tap **Set switch** to enter switch setting interface.

Tap the related switch and the status. Then click to return.

Note: The control switch, such as SWA, can also be selected by toggling the corresponding control on the transmitter.

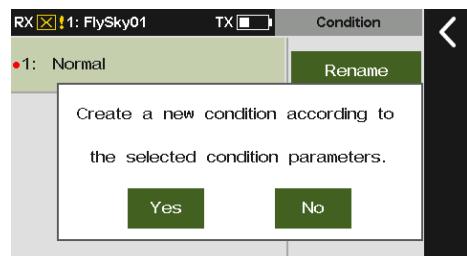

8.2.3 Creating/Copying A Condition

To create a new condition.

Setup:

Tap **New/Copy** and a pop-up screen comes along with it. Click **Yes** to complete. Then click to return.

8.2.4 Deleting A Condition

To delete a condition selected.

Setup:

1. Tap a condition you want to delete.
2. Click **Delete** and a pop-up screen comes along with it. Click **Yes** to complete. Then click to return to the previous interface.

Note: If there is but one group of condition, you cannot delete it, namely there is no Delete function item.

8.2.5 Changing The Order Of The Conditions

Changes the order of the conditions so as to change the priority. The condition corresponding to the serial number 5 has the highest priority, and the number 4 is the next highest priority. The system works in this way according to this sequence.

Setup:

1. Tap to select a condition.
2. Click to move the condition selected forward. Click to move the condition selected backward.

Notes:

1. Condition 1 is the default condition. It does not support settings of switch and change its order, i.e., the serial number of default condition is 1.
2. After the transmitter is turned on, the system will automatically judge whether the switch of condition 5 is on or off. If it is on, it will work in the condition 5. If it is not on, the system will judge whether the switch of condition 4 is on or off. If it is on, it will work in the condition 4. The system works in this way according to this sequence.

8.3 Func. Rate(AFR)

Note: This function is available for version 1.0.65 or later.

You can set servo volume change curves of all sticks, knobs, and switches assigned to the channel. You can switch to different conditions to set different curves respectively. The servo volume change curve for the conditions controlled by DR is set after enabling the DR. Those not supporting the assignment of the master control, such as Flap 2, cannot be set. The allocation of the same function of different channels from any setting entrance into the settings is the same. It is recommended that the **Func. rate** be set after the channel travel setting is completed. Any mixes source will be applied the **Func. rate** function.

Display the real-time position of the control assigned to this function.

Display the real-time output rate of this function.

Note: The function shown in grey cannot be selected.
Tap to enter the corresponding rate setting interface of each channel.

Tap to select EXPB.
Tap to select EXPB.
Tap to select EXPB.
Tap to select Offset.

Display the real-time rate and line type.

Note: RateA is the ratio to the left of the neutral, and vice versa for RateB. EXPB is the curve to the left of the neutral, and vice versa for EXPB. Rate A/B and EXPB are selected separately or fully depending on the curve type, when the curve type is EXP1, EXP1 can not be adjusted separately although it distinguishes between A and B. When the curve type is EXP2, SYMM (symmetric), the rate and curve are divided into A and B. A and B need to be set in linkage, and cannot be adjusted individually. When the curve type is EXP2, LINE, the rate and curve are divided into A and B, and both A and B can be adjusted separately.

8.3.1 Setting Curve Type

Set the curve type.

Setup:

Enter the rate setting interface. Tap EXP, SYMM repeatedly to toggle among the selections.

Please note that the data will be reset when the line type is changed.

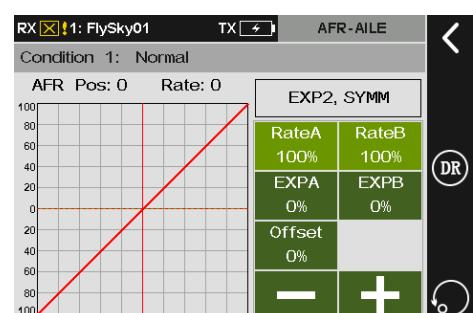

8.3.2 Setting Rate/EXP/Offset

Set the related **Rate**, **EXP** and **Offset** after a line type has been set. Take Rate setting as an example.

Setup:

1. Enter the rate setting interface and set to EXP2, LINE.
2. Tap Rate A, the item selected will turn to light green.
3. Click + or - to set a appropriate rate value.

For the setting of EXP and Offset, refer to the setting of Rate.

8.4 DR Setting

Note: This function is available for version 1.0.65 or later.

Set the function, switch of DR and effective condition to enable the DR. The transmitter supports 10 groups of DR. When 2 or more sets of D/R are set to the same function and both are turned on, the one after the other has higher priority.

Setup:

1. Access DR setting interface, tap a function box corresponding to a DR to enter.
2. Tap a appropriate function, then click to return to the previous interface.
3. Tap the function box corresponding to the DR below the Switch and set a switch to the function. Then click to return to the previous interface.
4. Tap the function box below the Mode, tap the mode which activate DR mode. Then click to return to the previous interface.

Notes:

1. When all 5 conditions in the transmitter are selected, All is displayed.
2. If some conditions are selected, the serial number of the selected condition is displayed.
3. If there is no condition selected, Disabled is displayed.
4. The function of linkage control does not support settings of DR.

8.5 Channel Offset

This function allows you to adjust the offset value of each channel, and you can set different offset value in different conditions. The offset value caused by the model can be corrected using this function. Too much offset setting will lead to a reduction in the amount of control at one end of the channel. If the aircraft structure deviates greatly, please try to adjust the aircraft first.

Setup:

1. Tap a channel you want to adjust to enter.
2. Click + or - to change the offset value to the desired point. Then click to return to the previous interface.

微信公众号

Bilibili

Website

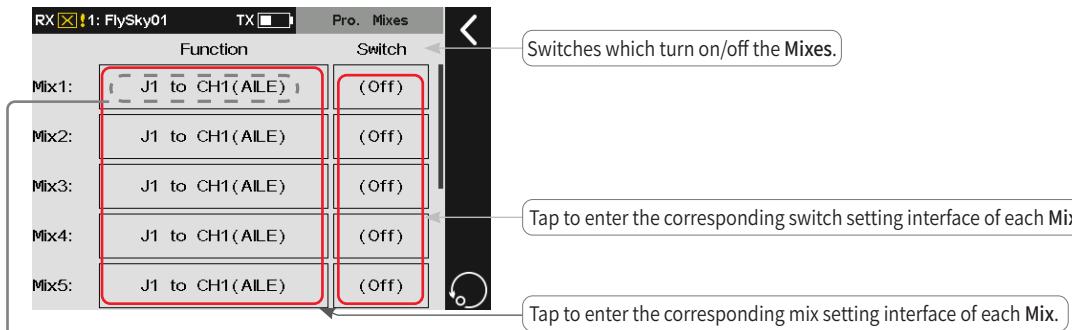

Facebook

8.6 Program Mixes

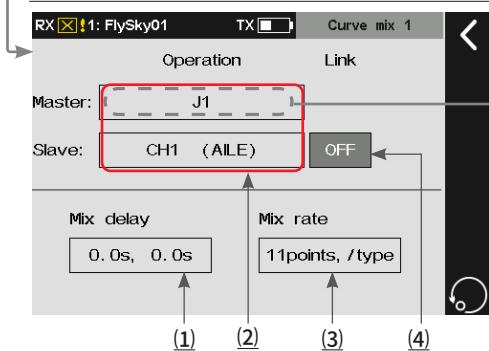

Note: The TEL item is added for version 1.0.70 or later.

A new special control combo can be created to correct the disadvantages of the model. You can select a stick/knob or a function as a **Master**. When selecting a function, you can set whether other mixes associated with the function affect the **Slave** of the same group and whether the trim affects the **Slave**. The function can be used to set the servo change of the **Master** mapping to the **Slave** channel through a custom curve. You can set a switch to enable/disable the **Mix**, and set the delay to enable/disable the **Mix** function. Please note if the master is set to ease by **Set by function** in the **Servo speed** function, the **Slave** will also follow the **Master** execution of easing.

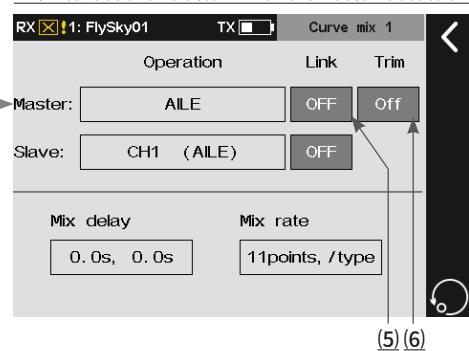

It can be used for a variety of applications: link with other mixes, separate link settings for the master and slave with reversal direction of the connection; trim mode enabled or disabled; and curve mixing rate and mixing delay can be set separately for each group of **Mix**.

The interface shows below when the **Master** is set to a control.

The interface shows below when the **Master** is set to a function.

- (1) Tap to enter the interface of Mix delay.
- (2) Click to enter the corresponding interface of Master or Slave.
- (3) Tap to enter the interface of Mix rate.
- (4) Tap to set the link mode of Slave to Master.
- (5) Tap to set the link mode of Master to Slave.
- (6) Tap to set to turn on/off the trim of Master.

Note: When the **Mix** activates and the trim of its **Master** is set to **On**, the trim of its **Mater** will affect its **Slave**. If the trim is set to **Off**, the trim of **Master** will not affect the **Slave**.

8.6.1 Setting Master And Slave

Set related settings of **Master** and **Slave**.

- (1) Tap to enter the screen of setting **Master's control**.
- (2) Click to enter the screen of setting **Master's function**.

Master Selection

Set related settings of **Master**. Master can be set to a control or a function.

Setup:

1. Tap the function box next to **Master** to enter.
2. Tap **Stick or Knob** to enter if you want to set **Master** to a control. Tap the desired control or knob you want to set. Then click to return to the previous interface.
3. Tap **Func.(function)** to enter if you want to set **Master** to a function. Tap the desired function you want to set. Then click to return to the previous interface.

For **Slave**, you can only set it to a function, for the function setting of **Slave**, please refer to the descriptions of **Master** above.

Note: When **Master** is set as a control, the **Link** and **Trim** function are disabled, that is, it will not appear **Link** and **Trim** items.

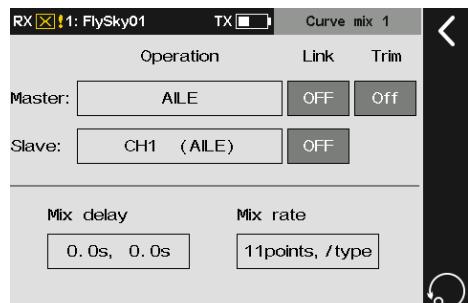

Master Link/Slave Link

The link can be set for **Master** and **Slave**, when **Master** is set to a specific function. The **Link** is to set whether the master function will affect the slave function when it is affected by other mixes. **Slave Link** is to achieve the result of this group of mixers used as a source of link for other mixes to select this group of slave functions as its master.

Setup:

Tap the function box below **Master Link**. You can click repeatedly to toggle among **NOR**(normal), **REV**(reverse) or **OFF**.

Note: **Nor**(normal) refers to a forward call, and **REV**(reverse) refers to a reverse call. When **Master Link** is set to **OFF**, other function mixing volume will not affect **Slave**.

Take the link setting between **Mix1** and **Mix2** as an example.

Mix1			Mix2		
Master	Func.	ELEV	Master	Func.	AILE
	Link	OFF		Link	NOR/REV
Slave	Func.	AILE	Slave	Func.	THRO
	Link	NOR/REV		Link	OFF

Master Trim

Set related trim settings of **Master**.

Setup:

Tap the function box below **Master Trim**. You can click repeatedly to toggle between **Off** or **On**.

Note: When the trim is set to **On**, Master trim changes will also affect **Slave**. When it is set to **Off**, Master trim changes will not affect **Slave**.

微信公众号

Bilibili

Website

Facebook

8.6.2 Setting Mix Delay

Set the delay time for the current condition from triggering to taking effect for **Open delay** or **Close delay** of the Mix. If the **Mix delay** needs to be set for other conditions, switch to other conditions prior to settings.

Setup:

1. Tap **Open delay** or **Close delay**.
2. Click + or - to set the appropriate value. Then click  to return to the previous interface.

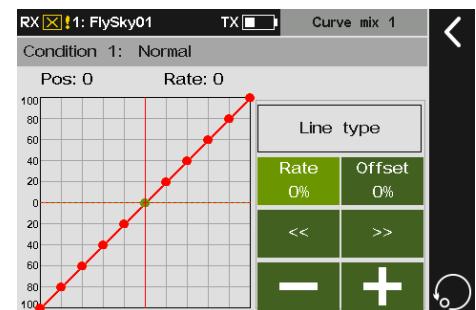

8.6.3 Setting Mix Rate

Set the mix rate for the channel for the current condition.

Setup:

1. Tap **Line type** to enter the interface if you want to change the line type and amount of the dots.
2. Tap the appropriate item and click **Yes** in the pop-up menu to complete.
3. Tap **Rate** or **Offset**.
4. Tap **«** or **»** to select a dot.
5. Click + or - to set the appropriate value. Then click  to return to the previous interface.

If the models are the multi-aileron, multi-elevation or multi-flap structure, you can set the mix through the aileron, flap and elevation mix function when the mixes are required for aileron, elevation and flap.

8.7 Servo Speed

Note: This function is available for version 1.0.65 or later.

Introduce the settings of the **Servo speed** function. Usually, you can use this function if you want to simulate the movement of a real aircraft, and you can use this function to set some maneuvering parts that need to change slowly.

Set by Function

It is the easing that sets the main function of the model. After settings, all the channel volumes related to this function will execute ease.

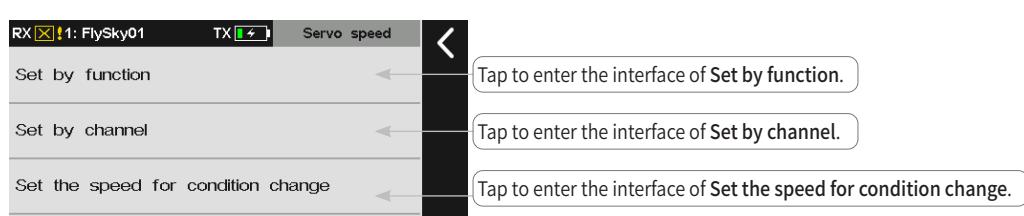

Set by Channel

All output from this channel will be eased.

Set the speed for condition change

All the related channel volumes will be eased when switching from one condition to another condition.

Note: The corresponding function interfaces vary with model structures (for example, an aircraft with or without a tail).

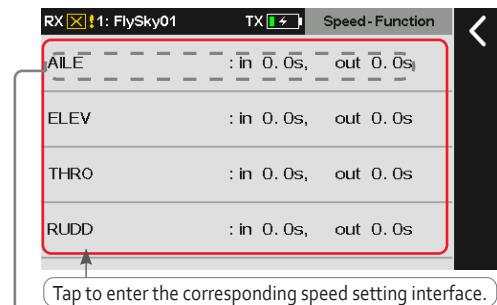

8.7.1 Servo Speed- Set By Function

This can reduce the output speed of some main functions (such as aileron, throttle, rudder, spoiler, etc.). The easing time of starting(**In speed**) and returning(**Out speed**) can be set separately, that is, the easing time can be changed by different start and returning speeds.

After setting the delay for the master function, all channel outputs associated with this function will be eased. If the **Pro. Mixes** uses this main function as the master, the slave outputs of the same group will also be eased. For example, if you set the aileron function delay time to 2S, the corresponding slave outputs of the aileron functions such as **Aileron to Elevator**, **Aileron to Rudder** and other mix functions will also change slowly.

Setup:

1. Tap item you want to set to enter.
2. Tap the function box next to **In speed**, then click + or - to set the time.
3. Tap the function box next to **Out speed**, then Tap + or - to set the time.
4. Tap the function box next to **Type**, then click ↻ to return to the previous interface.

Tap to enter the corresponding speed setting interface.

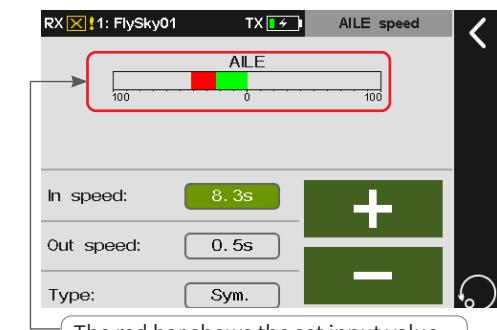

(1) Tap to select **In speed**, the shorter time is, the faster speed is.

(2) Tap to select **Out speed**, the shorter time is, the faster speed is.

(3) Tap to toggle between **Line** and **Sym.** (**Sym** means the neutral (ratio: 0%) is the reference point. **Line** means the low end (ratio: smallest value) is the reference point).

Note: Recovery refers to the value change from far from the reference point to close to the reference point, which is output by **Out speed**. Start refers to the value change from close to the reference point to far from the reference point, which is output by **In speed**.

After setting, the interface shows below when push/pull the control which is assigned to the channel.

The red bar shows the set input value, the green shows the output value.

8.7.2 Servo Speed- Set By Channel

This can reduce the output speed of channels (such as CH1, CH2, etc.). The easing time of start and recovery can be set separately, that is, the easing time can be changed by different start and recovery speeds.

You can use this function if you want to simulate the movement of a real aircraft or make up the mechanical virtual position of the servo.

微信公众号

Bilibili

Website

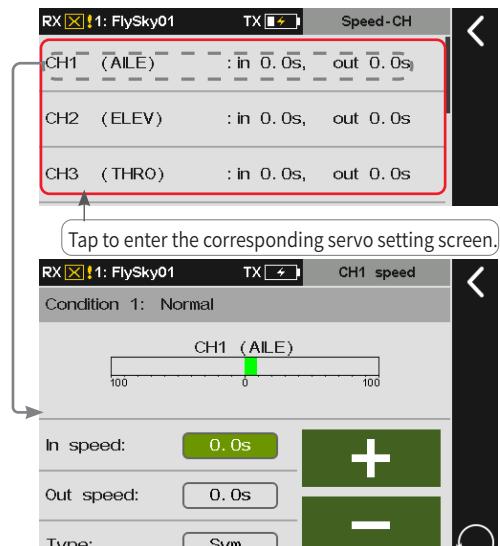

Facebook

After setting the easing time, all the volumes output from this channel execute the easing.

Setup:

1. Tap item you want to set to enter.
2. Tap **In speed**, then click + or - to set the appropriate time.
3. Tap **Out speed**, then click + or - to set the appropriate time.
4. Tap the function box next to **Type**, then click **☒** to return to the previous interface.

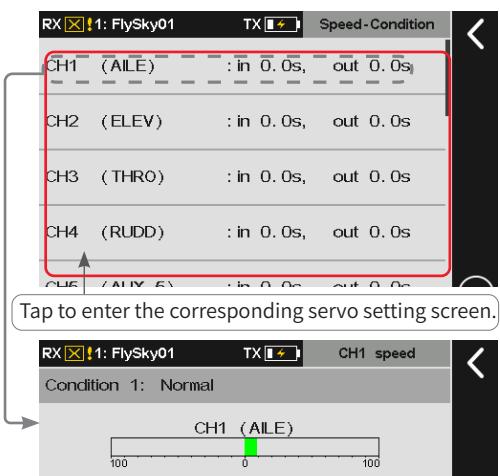

8.7.3 Servo Speed- Set By Condition

This can reduce the output speed of channels which is changed caused by condition switching.

You can use this function for some special flight which is in smooth transition. For example, it recommends that you should use this function if from NOR mode (Normal Mode) to 3D mode (Aerobic Mode).

Setup:

1. Tap item you want to set to enter.
2. Tap **In speed**, then click + or - to set the appropriate time.
3. Tap **Out speed**, then click + or - to set the appropriate time.
4. Tap the function box next to **Type**, then click **☒** to return to the previous interface.

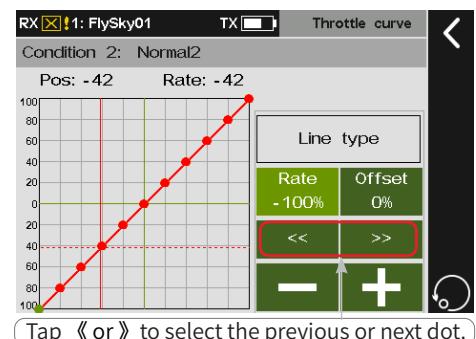

8.8 Throttle Curve

Note: This function is available for version 1.0.65 or later.

This function allows the throttle control lever to respond to engine speed changes more as expected to achieve the best results in the control of the engine. Different input and output rate factors (up to 11 points) are set through multi-point curves. The throttle curve will operate on input values of all control levers assigned to the throttle function before the next step (**Func. rate**). The multi-engine model throttle curve will operate for all throttle control levers. This setting is for the current condition. For the settings of other conditions, switch to other conditions first and then carry out the settings.

Setup:

1. Tap **Line type** to enter the interface if you want to change the line type and amount of the dots.
2. Tap the appropriate item and click **Yes** in the pop-up menu to complete.
3. Click **Rate** or **Offset**.
4. Click **«** or **»** to select a dot.
5. Tap + or - to set the appropriate value. Then click **☒** to return to the previous interface.

Note: The horizontal axis represents the input value of the throttle stick. The vertical axis represents the output value of the throttle after calculation.

8.9 Throttle Cut

Note: This function is available for version 1.0.65 or later.

This function is a special setting for oil-operated engine. The Cut switch, Cut position and Cut Threshold can be set. When the throttle control stick is within the throttle cut threshold, toggle the throttle cut switch to turn off the engine. The output value of the throttle function when the throttle cut is in effect is the throttle cut position value. It will be limited by the channel reverse function and the channel range function, and all other volumes operated to the channel corresponding to this throttle are invalid. However, the other functions of throttle mixing are still worked.

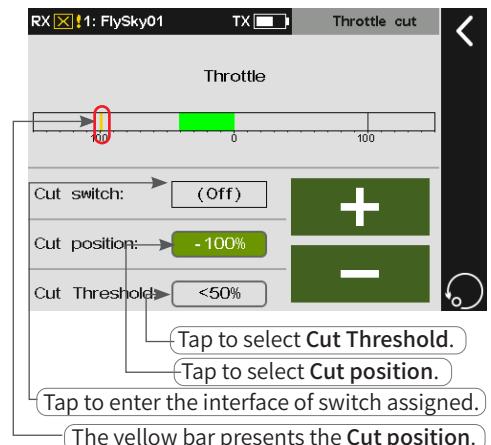

Multi-engine model can be set with the throttle cut separately for throttle, throttle 2, throttle 3 and throttle 4.

Setup:

1. Tap the function box next to **Cut switch** to enter.
2. Set a switch to turn on or off the **Throttle cut**. Then click to return to the previous interface.
3. Tap the function box next to **Cut position**, then click or to set the appropriate value. Click to return to the previous interface.
4. Toggle the switch to confirm whether it works properly.

Notes:

1. When multiple throttles are to be set, choose Models > Type > Optional, and click Throttle, to select the appropriate number of throttles. After setting, this interface will show multiple throttles. Click the corresponding throttle to set them separately. Refer to the above for settings.
2. For settings of switch, refer to the descriptions in chapter 16.

The interface for multiple throttle

8.10 Idle Up

Note: This function is available for version 1.0.65 or later.

This function can be used to set the throttle idle position, which can prevent the engine from shutting down when the throttle stick is in a lower position. The minimum throttle position is defined by setting the offset value. Once this function is activated, the minimum throttle setting (idle point) will be determined by the offset value showed as a percentage. For safety reasons, this function will work only when the throttle stick is below the lower position (-20%). The idle speed offset values of -100-0-100 correspond to a ratio factor of 80%-100-120%. The throttle control ratio will be multiplied with the ratio factor corresponding to the offset when the idle speed is enabled for the subsequent operation (throttle curve). When the throttle cut is enabled, the throttle hold and this function are not valid.

In multi-engine model, the idle switch is recognized only in the "throttle" control position (below -20%), and the throttle, throttle 2, throttle 3 and throttle 4 will be calculated when the idle is enabled.

Setup:

1. Tap the function box next to **Idle switch** to enter.
2. Set a switch to turn on or off the **Idle up**. Then click

微信公众号

Bilibili

Website

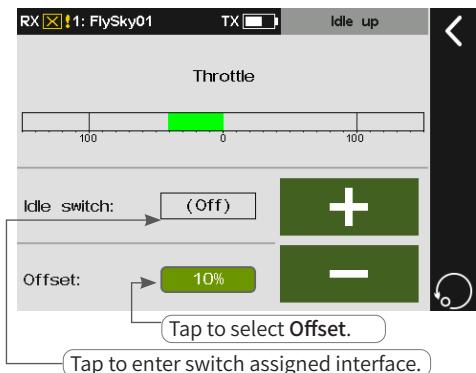

Facebook

return to the previous interface.

- Tap the function box next to **Offset**, then click + or - to set the appropriate value. Click **↶** to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

Note: If the offset value is negative, it means the idle speed is rising. When the offset value is maximum, it indicates that the throttle stick is close to the minimum throttle.

8.11 Throttle Needle

Note: This function is available for version 1.0.65 or later.

The throttle needle function is set for some models with a throttle needle. This function is used to set the output rate of the throttle needle master control in a multi-point curve method.

For example, if you need to link a throttle to a needle, you can assign the throttle needle controlled by the throttle stick, and realize the control of the throttle stick to the needle by setting the curve.

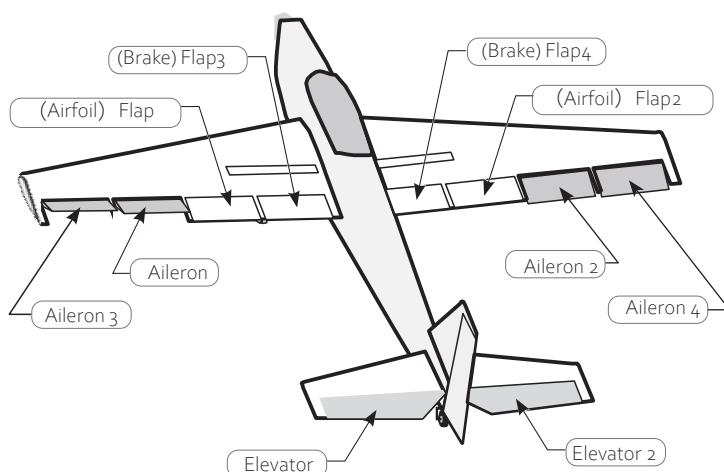

The setting steps of throttle needle are similar to the setting steps of throttle curve. Refer to the related settings of throttle curve.

8.12 Aileron

Note: This function is available for version 1.0.65 or later.

This section introduces the settings of the aileron and its mixes function. The parameter settings of this function are for the current condition. To set in another condition, you need to switch the condition first.

Note: Due to the different model structures (for example, different number of ailerons and flaps), the corresponding function interface may be different. Usually, up to four ailerons are described as an example.

8.12.1 Aileron Differential

The left and right ailerons of the aircraft or glider can be adjusted independently. The differential aileron adjustment can be achieved by setting different high and low rate values for each aileron.

Take the setting of **Low** as an example.

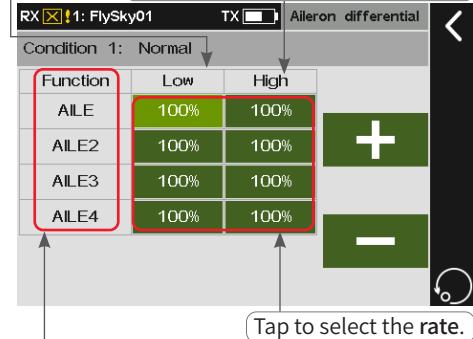

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click ↺ to return to the previous interface.

For the setting of **High**, refer to the setting of **Low**.

Low indicates the input low end, that is, the low end of control.

High indicates the input high end, that is, the high end of control.

Function indicates the function item.

Note: "Function", "Low (low end rate)" and "High (high end rate)" in the interface of the Aileron, Flap, Elevation, Spoiler, and Rudder functions have similar meanings.

8.12.2 Aileron Elevator

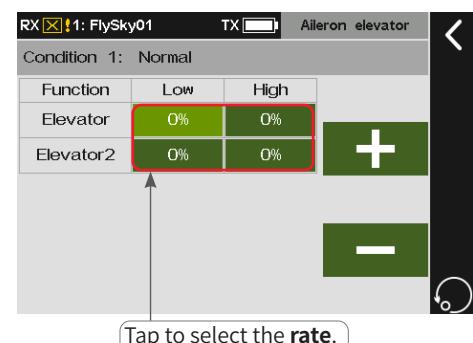

Sets the elevator with the aileron function to improve the model's roll performance. Only the aircraft with the two elevator tails supports this function. You can set the high and low rate values of the two elevators to move with the aileron function.

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click ↺ to return to the previous interface.

For the setting of **High**, refer to the setting of **Low**.

Function indicates the function item.

8.12.3 Aileron Camber Flap

This mix function is used to set the linkage between the camber flap and the aileron so that the flap can work together with the aileron, thus improving the maneuvering characteristics around the longitudinal axis.

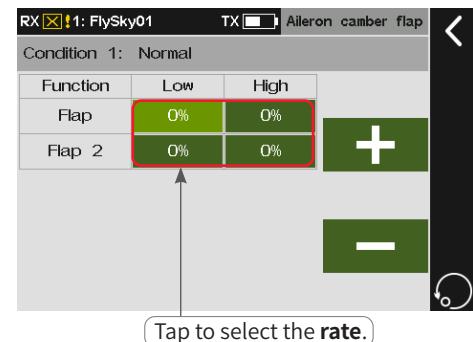

Note: This function is only available for the model with 2 or 4 flaps.

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click ↺ to return to the previous interface.

For the setting of **High**, refer to the setting of **Low**.

Function indicates the function item.

微信公众号

Bilibili

Website

Facebook

8.12.4 Aileron Brake Flap

This mix function is used to set the linkage between the brake flap and the aileron so that the flap can work together with the aileron, thus improving the maneuvering characteristics around the longitudinal axis.

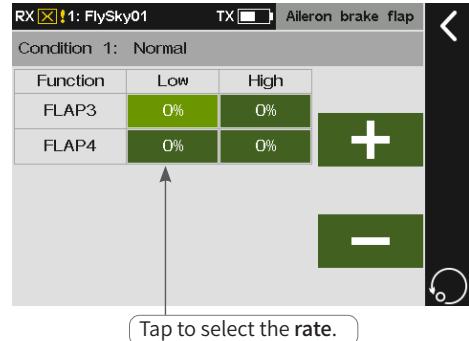

Note: This function is only available with 4 flaps.

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click ↺ to return to the previous interface.

For the setting of **High**, refer to the setting of **Low**.

8.12.5 Aileron To Elevator

Usually more lift is needed on ailerons when turning/rolling. This function allows you to set the compensation rate of the elevator during aileron movement, so that the elevator will be subject to a compensatory trim according to the set rate during aileron movement, thus preventing the nose-down of the aircraft.

Note: If the model structure is a tailless (flying wing) aircraft, the aileron can be used as an elevator. This setting will affect all elevator surfaces, and even the aileron surfaces in case of a tailless aircraft.

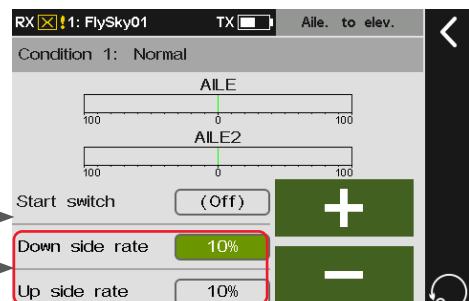

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value.
3. Set a switch to enable this function. Tap the box next to **Start switch** to enter switch assigning interface. Then click ↺ to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

For the setting of **High**, refer to the setting of **Low**.

8.12.6 Aileron To Rudder

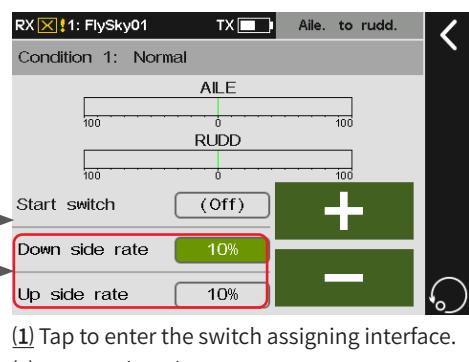

This mix function is used to set the linkage between the steering servo and the aileron. This function can be set to achieve the more coordinated and flexible steering and roll through the compensatory trim of the steering servo during the aileron movement.

Note: When there are two rudders, rudder 1 and 2 will both be affected.

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The

currently function item selected is highlighted in light green.

2. Click + or - to set the appropriate value.
3. Set a switch to enable this function. Tap the box next to **Start switch** to enter switch assigning interface. Then click  to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

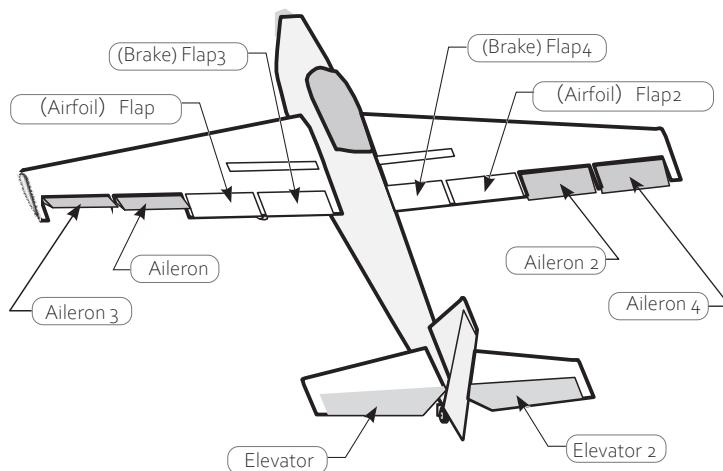

For the setting of **High**, refer to the setting of **Low**.

8.13 Flap

Note: This function is available for version 1.0.65 or later.

This section introduces the settings of the flap and its mixes function. The parameter settings of this function are for the current condition. To set in another condition, you need to switch the condition first.

Note: Due to the different model structures (for example, different number of ailerons and flaps), the corresponding function interface may be different. Usually, up to four ailerons are described as an example.

8.13.1 Flap Setting

This function is used to set the high and low end rates and offset of flaps separately, that is, for a model with multiple flaps, the flap upward and downward movement travel and neutral point position on each flap can be adjusted independently.

Note: The number of interface flap function items is related to the Wing through Models.

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click  to return to the previous interface.

For the setting of **High** and **Offset**, refer to the setting of **Low**.

Offset indicates the input which centers on the neutral position will move lower or higher according to the offset value.

RX [] 1: FlySky01 TX []		Flap setting
Condition 1: Normal		
----- Airfoil flap -----		
Function	Low	High
Flap	100%	100%
Flap 2	100%	100%
----- Brake flap -----		
FLAP3	100%	100%
FLAP4	100%	100%

(1) Tap to select the rate.

Note: Offset in the interface of the Flap and Airbrake has similar meanings.

微信公众号

Bilibili

Website

Facebook

8.13.2 Brake To Airfoil

This mix function is used to set the high to low rate of brake flaps to airfoil flaps. It is used to adjust the up/down movement travel range of multiple flaps independently.

Note: This function is only available with 4 flaps.

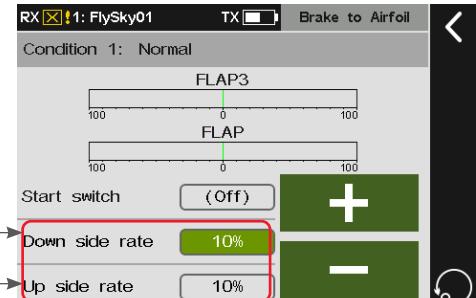

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value.
3. Set a switch to enable this function. Tap the box next to **Start switch** to enter switch assigning interface. Then click ↺ to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

For the setting of **High**, refer to the setting of **Low**.

(1) Tap to enter the switch assigning interface.

(2) Tap to select the rate.

8.13.3 Airfoil To Elevator

This mix function is used to set the linkage between the airfoil flap and elevator. You can set a compensatory trim for the elevator to prevent the aircraft from diving when the airfoil flap is operated to slow down.

For model with normal tail/V tail/Ailavator (double elevator) tails, the function item is only Elevator/Elevator 2. For those having aileron but without tail (There is no elevator function item, the number of aileron function items are subject to the actual number of ailerons), set the aileron as the elevator, so as to use the Airfoil to Elevator function.

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click ↺ to return to the previous interface.

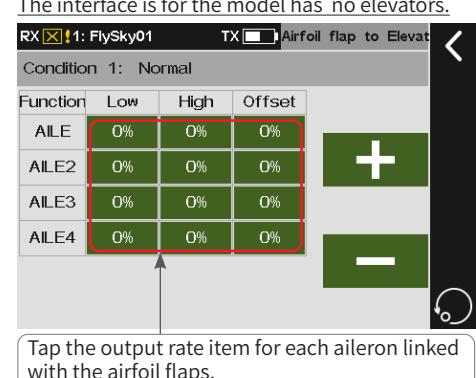

For the setting of **High**, refer to the setting of **Low**.

The interface is for the model has elevators.

Tap the output rate item for each elevator linked with the airfoil flaps.

The interface is for the model has no elevators.

Tap the output rate item for each aileron linked with the airfoil flaps.

8.13.4 Brake Flap To Elevator

This mix function is used to set the linkage between the brake flap and elevator. You can set a compensatory trim for the elevator to prevent the aircraft from diving when the brake flap is operated to slow down.

Note: This function is only available with 4 flaps.

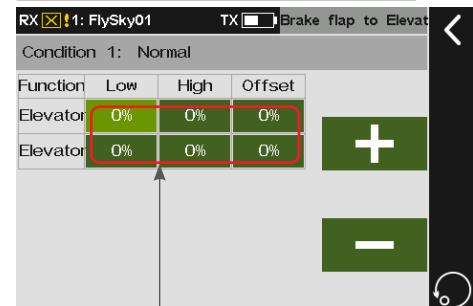

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click < to return to the previous interface.

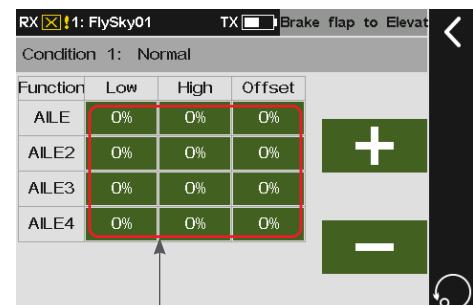

For the setting of **High** and **Offset**, refer to the setting of **Low**.

The interface is for the model has elevators.

Tap the output rate item for each elevator linked with the brake flaps.

The interface is for the model has no elevators.

Tap the output rate item for each aileron linked with the brake flaps.

8.14 Airbrake

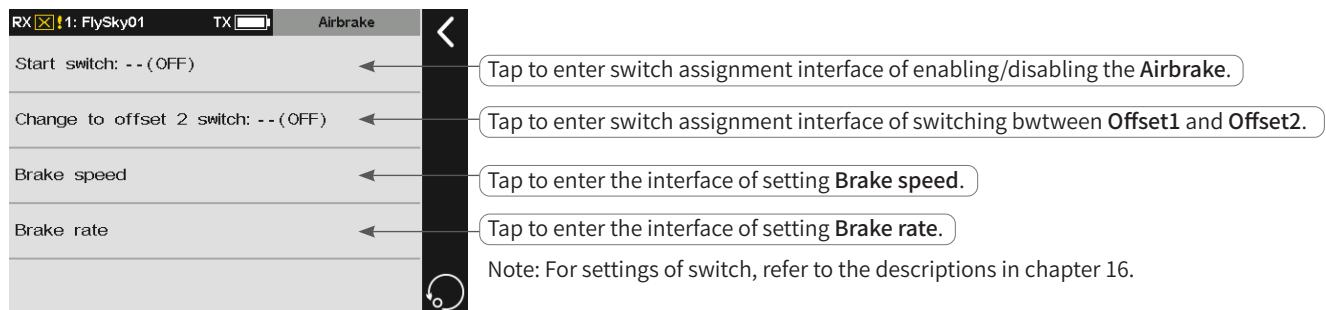

Note: This function is available for version 1.0.65 or later.

When the control model is ready to descend or land, the air brake function can be used to help decelerate. This function is achieved by setting the offset values of ailerons, spoilers and elevators.

The offset values of ailerons, flaps, spoilers and elevators can be set in two sets. Enable/disable the Airbrake and switch between different offsets by assigning controls.

Notes:

1. Due to the different model structures (for example, different number of ailerons), the corresponding function menu may be different. Usually, up to four ailerons are described as an example.
2. Two brake rates can be realized by setting a three-position switch with two positions corresponding to offset 1/offset 2 respectively.

微信公众号

Bilibili

Website

Facebook

8.14.1 Brake Speed

Sets the parameters related to the brake speed function. You can set the time to complete the action when the brake is enabled and disabled. The longer the time, the slower the speed.

Take the setting of **Offset 1 brake** as an example.

Setup:

1. Tap **Offset 1 brake**, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click  to return to the previous interface.

For the setting of **Offset 2 brake** and **Stop braking**, refer to the setting of **Offset 1 brake**.

(1) Tap to select **Offset 1 brake**.

(2) Tap to select **Offset 2 brake**.

(3) Tap to select **Stop braking**.

8.14.2 Brake Rate

Sets the offsets of **AILE**, **Flap**, **Spoiler** and **Elevator** for the current condition. To set in another mode, you need to switch the condition first.

Take the setting of **Offset 1 brake** of **AILE** as an example.

Setup:

1. Tap the function box corresponding to **AILE**, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click  to return to the previous interface.

For the setting of offset value of other function, refer to the description above.

Tap to select **Offset** for the corresponding function.

8.15 Spoiler

Note: This function is available for version 1.0.65 or later.

Spoiler, also called deceleration flap, can achieve fast braking by increasing the aircraft pressure on the ground when the aircraft is descending. Meanwhile, the use of spoiler in flight can also achieve the effect of aircraft deceleration. This function can be used to set the upward and downward movements of each spoiler and the linkage between spoiler and elevator. If the spoiler is used during deceleration, the aircraft will tend to dive. If the elevator linkage is set, the flight attitude can be controlled through the compensatory trim of the elevator. The function parameter setting is for the current condition. To set in another condition, you need to switch the condition first.

Notes:

1. Due to the different model structures (for example, different number of ailerons), the corresponding function menu may be different. Usually, up to four ailerons are described as an example.
2. If it is a flying wing type aircraft, the elevation setting item is aileron; or, use the flap function to add setting interfaces for the aircraft.

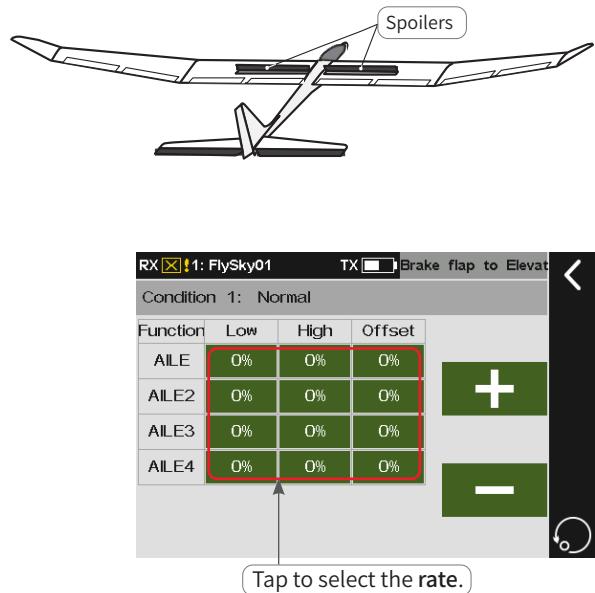

Take the setting of **Low** as an example.

Setup:

1. Tap the item corresponding to **Low** you want to set, The currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click **Esc** to return to the previous interface.

For the setting of **High**, refer to the setting of **Low**.

8.16 Elevator

Note: This function is available for version 1.0.65 or later.

This section introduces the settings of the elevator and its mixes function. The parameter settings of this function are for the current condition. To set in another condition, you need to switch the condition first.

Notes:

1. Due to the different model structures (for example, different number of ailerons and flaps), the corresponding function menu may be different.
2. The aileron movement mode is not restricted in the mixing linkage of the elevator and aileron.

8.16.1 Elev. Linkage

This mix function is used to adjust the rise and fall rates of left and right elevators separately.

Take the setting of **Low** as an example.

Setup:

1. Tap the function box corresponding to **Low** you want to set, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click **Esc** to return to the previous interface.

For the setting of **High**, refer to the description above.

微信公众号

Bilibili

Website

Facebook

8.16.2 Elev. Aileron

This mix function is used to set the linkage between the elevator and aileron. For the models with elevator, the elevator can link the aileron to move homodromously to increase the lift. For the models without tail, the aileron 2 master control can be used to link the aileron to move homodromously to achieve the rise and fall function.

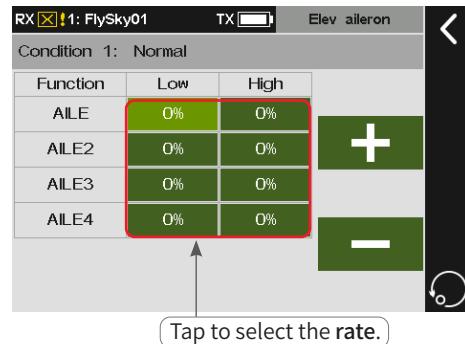

Note: This function item is not available for single aileron models. For multi-aileron models, the number of aileron function items depends on the actual number of ailerons.

Take the setting of **Low** as an example.

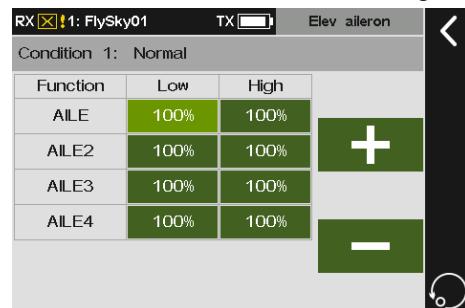

Setup:

1. Tap the function box corresponding to **Low** you want to set, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click ↺ to return to the previous interface.

The interface is for the model has tail wings.

The interface is for the model has no tail wings.

8.16.3 Elev. To Airfoil Flap

This mix function is used to set the linkage between the elevator and airfoil flap. When this function is enabled, the elevator/aileron 2 master control of the model will affect the airfoil flap proportionally, thus increasing the lift of the model.

Note: For tail-less aircraft, aileron 2 is used instead of elevator.

Take the setting of **Low** as an example.

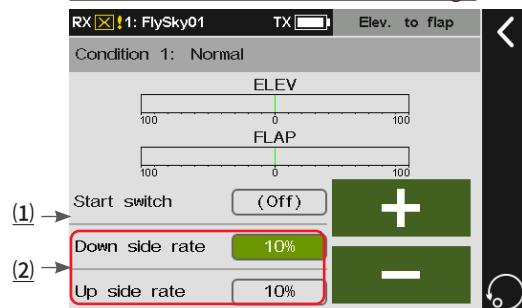

Setup:

1. Tap the function box corresponding to **Low** you want to set, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value.
3. Set a switch to enable this function. Tap the box next to **Start switch** to enter switch assigning interface. Then click ↺ to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

For the setting of **High**, refer to the setting of **Low**.

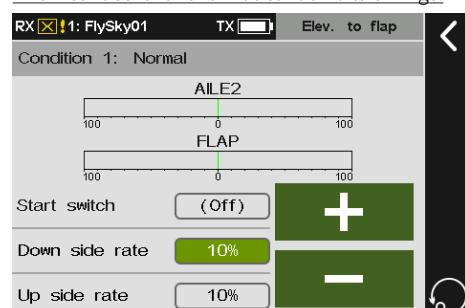

The interface is for the model has tail wings.

(1) Tap to enter the switch assigning interface.

(2) Tap the output rate item for airfoil flap linked with the elevator.

The interface is for the model has no tail wings.

8.16.4 Elev. To Brake Flap

This mix function is used to set the linkage between the elevator and brake flap. When this function is enabled, the elevator/ aileron 2 master control of the aircraft model affects the brake flaps in set rate, thus increasing the lift of the aircraft model.

Note: This function is only available for model with 4 flaps. For tail-less aircraft, aileron 2 is used instead of elevator.

Take the setting of **Low** as an example.

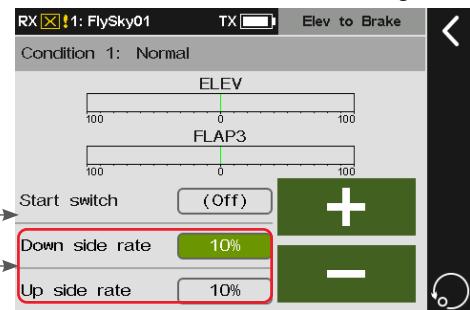

Setup:

1. Tap the function box corresponding to **Low** you want to set, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value.
3. Set a switch to enable this function. Tap the box next to **Start switch** to enter switch assigning interface. Then click ↺ to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

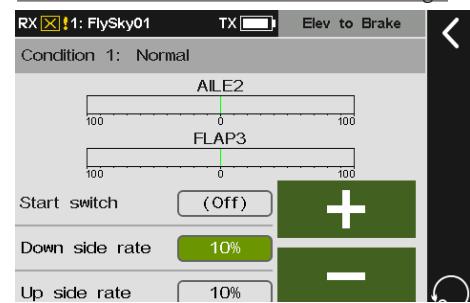

For the setting of **High**, refer to the setting of **Low**.

The interface is for the model has tail wings.

(1) Tap to enter the switch assigning interface.
(2) Tap to select the rate.

The interface is for the model has no tail wings.

8.17 Rudder

Note: This function is available for version 1.0.65 or later.

This section introduces the settings of the rudder and its mixes function. The parameter settings of this function are for the current condition. To set in another condition, you need to switch the condition first.

Notes: Due to the different model structures (for example, different number of ailerons and flaps), the corresponding function menu may be different. When the model type is set to tailless, this function is not available.

8.17.1 Rudd. Linkage

This function is applicable to the model with winglets, and is used to adjust the winglet rudder angle. The winglets are used to solve the wingtip vortex problem, thus reducing the induced drag and improve efficiency. The winglets are usually symmetrically erected vertically at both wingtips or extended outward at a certain angle.

Winglets increase the effective aspect ratio without significantly increasing the wing load and weight. Although the induced drag can be effectively reduced by extending the wing, this will also increase the parasitic drag and wing load strength at the same time, resulting in an insignificant gain. The winglets can effectively increase the aspect ratio without increasing the wingspan.

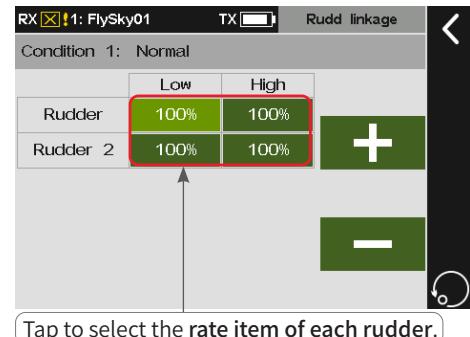

Note: This function is available for the model with tailless-2RUD.

Take the setting of **Low** as an example.

Setup:

1. Tap the function box corresponding to **Low** you want to set, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click ↺ to return to the previous interface.

For the setting of **High**, refer to the description above.

Tap to select the rate item of each rudder.

微信公众号

Bilibili

Website

Facebook

8.17.2 Rudd. To Aileron

This mixes function is used to set the linkage between the rudder and the aileron. It is used to adjust the rate that all control surfaces affecting the airfoil changes according to the airfoil. You can adjust with the two sides(Up/Down), and meanwhile you can correct the effect of these control surfaces on the direction of flight.

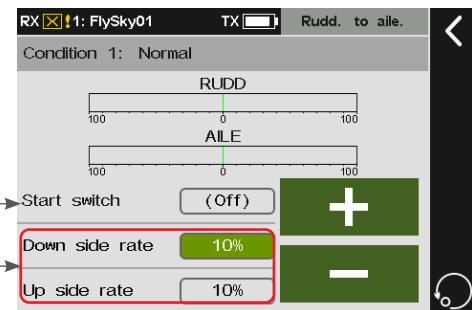

Take the setting of **Low** as an example.

Setup:

1. Tap the function box corresponding to **Low** you want to set, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value.
3. Set a switch to enable this function. Tap the box next to **Start switch** to enter switch assigning interface. Then click ↻ to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

For the setting of **High**, refer to the description above.

(1) Tap to enter the switch assigning interface.
 (2) Tap to select the output rate item for aileron linked with the rudder.

8.17.3 Rudd. To Elevator

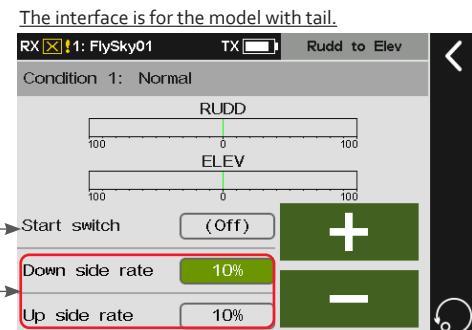

This mixes function is used to set the linkage between the rudder to elevator. This function is used when it is necessary to realize the linkage between the elevator and rudder, to correct the offset in the pitching direction when the aerobatic model aircraft is turning and flying laterally. For tailless aircraft, aileron 2 is used to replace the elevator to achieve the elevation function.

Take the setting of **Low** as an example.

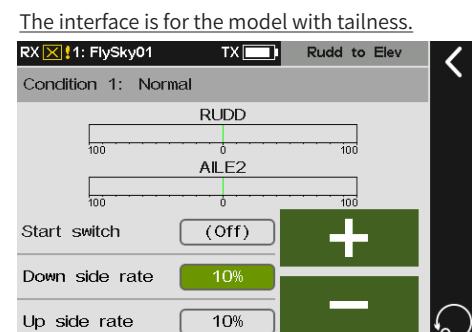

Setup:

1. Tap the function box corresponding to **Low** you want to set, the currently selected function item is highlighted in light green.
2. Tap + or - to set the appropriate value.
3. Set a switch to enable this function. Tap the box next to **Start switch** to enter switch assigning interface. Then click ↻ to return to the previous interface.

For the setting of **High**, refer to the description above.

(1) Tap to enter the switch assigning interface.
 (2) Tap to select the output rate item for elevator linked with the rudder.

8.18 Butterfly

Note: This function is available for version 1.0.65 or later.

This function realizes deceleration by adjusting the rates of ailerons, flaps, spoilers and elevator, i.e., ailerons are raised and flaps are lowered at the same time. This function is very effective when the model is landing, i.e., reducing the speed of the model, more stall margin is provided at the wingtip, thus less risk of wingtip stall. And more lift is generated at the root of the wing, allowing less gliding speed. The function parameter setting is for the current condition. To set in another condition, you need to switch the condition first.

Notes: This function is available for multi-flap airplane.

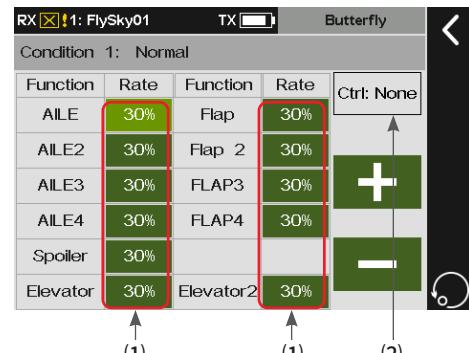

Take the setting of **AILE** as an example.

Setup:

1. Tap the function box corresponding to **AILE** you want to set, the currently selected function item is highlighted in light green.
2. Click + or - to set the appropriate value. Then click  to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

For the setting of other function, refer to the description above.

(1) Tap to select the rate.

(2) Tap to enter the switch assigning interface.

Note: The number of ailerons displayed is based on the settings of wing layout.

8.19 V Tail

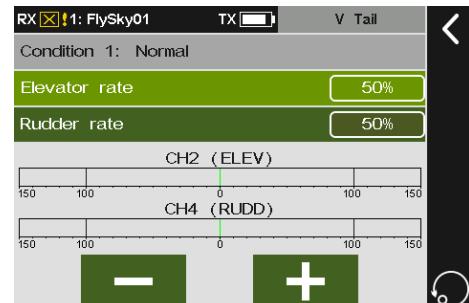

This function is used to adjust the rate of the V-shaped tail's 2 tail fins in steering and pitching manes. The V-shaped tail aircraft performs the rudder and elevator movements via 2 servos. In this system, one of the tail implements the rudder function and the other performs the elevator function, corresponding to two channels respectively. When the rudder function is implemented, the two control surfaces move in opposite directions. When the elevator function is implemented, the two control surfaces move in the same direction. This interface allows you to set the elevator rate and rudder rate, i.e., the rate of the elevator is for realizing the elevator function and the rate of the rudder is for realizing the rudder function.

The function parameter setting is for the current condition. To set in another condition, you need to switch the condition first.

Note: This function is available for models with V Tail.

Setup:

1. Tap **V Tail** to enter the setting interface.
2. Tap **Elevator rate**, then click + or - to set an appropriate value.
3. Tap **Rudder rate**, then click + or - to set an appropriate value. Click  to return to the previous interface.

8.20 Logic Switches

Note: Adds a set of logic switch. This is available for version 1.0.6g or later.

A logic switch is a virtual switch consisted of 2 to 4 switches which activates or deactivates according to a mathematical relationship.

If there is any mathematical logic relationship between certain switch controls and the other two switch controls, this function can be used to express this logic and use it as a logic switch in control. The logic switch can be selected in any menu where switches can be assigned.

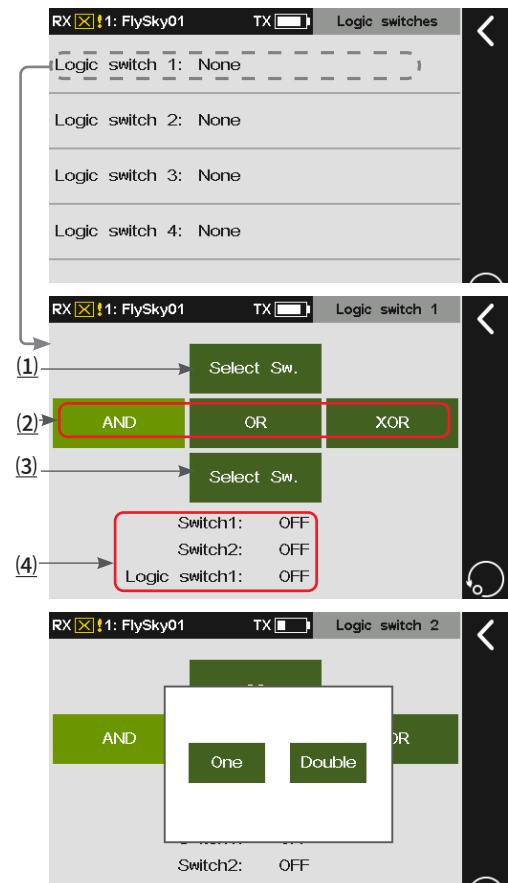

The system supports to set four groups of logic switches in total. There are three logic definitions between two switches: AND, OR and XOR.

Setup:

1. Tap a logic switch and enter the settings interface.
2. Tap the -- at the top of the interface,
 - Choose **One** to enter the switch interface to select the switch and its state, then click  to return and complete the setting for the -- at the top.
 - Or choose **Double** to enter the next level interface; First, click on the -- at the top of this interface to enter the switch interface and select the switch and its state. Then click on the -- at the bottom of this interface to enter the switch interface again and select another switch and its state. Click  to return and complete the setting for the -- at the top.
3. Tap the -- at the bottom of the interface.
 - Follow step 2 to choose **One** or **Double** to complete the setting for the -- at the bottom.
4. Tap **AND**, **OR** or **XOR** to select the logical operation relationship (for detailed information on logical operation relationships, please refer to the table below).
5. Test the switches by toggling them and check if the settings meet the requirements through the switch state display on the interface.

Note: The setting of a logic switch makes sense only if it is composed of 2 other different switches.

Switch		Logic switch		
Switch 1	Switch 2	AND	OR	XOR
OFF	OFF	OFF	OFF	OFF
OFF	ON	OFF	ON	ON
ON	OFF	OFF	ON	ON
ON	ON	ON	ON	OFF

(1) and (3) Tap here to enter switch assignment menu.

(2) Tap here repeatedly to select among **AND**, **OR** or **XOR**.

AND: where the logical switch is activated only when both physical switches are open; if one or both physical switches are closed, the logical switch is deactivated.

OR: where the logical switch is activated if at least one of the two sets of physical switches is open or both are open; if both sets of physical switches are closed, the logical switch is deactivated.

XOR: where the logical switch is activated when one set of physical switches is closed and the other is open; if both sets of physical switches are either closed or open simultaneously, the logical switch is deactivated.

(4) Display the status of two sets of switches and the status of the logical switch after logical operation.

8.21 Attitude

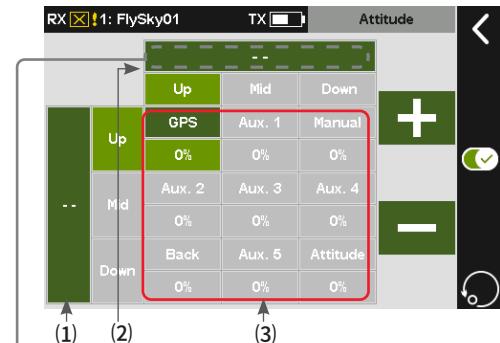

This function allows the setting up to 9 output values for channels assigned with attitude functions. The output value of the channel can be switched via the set combo switch.

Function setup:

1. Tap **Attitude** to enter the setting interface.
2. Tap the function box with "--" to enter the switch assignment interface. Tap a switch you want to set or push/pull the physical switch on the transmitter. Click **⬅** to return to the previous interface. After these two switches are assigned, the function and its output value are controlled by the combo switch.
3. Change the names of the presets by tapping the dark green function box you want to change. A pop-up menu comes along with it, you can tap the appropriate character then click **Enter** to complete.
4. Click + or - to set the appropriate value. Use the combo switch to switch the function. Click **⬅** to return to the previous interface.

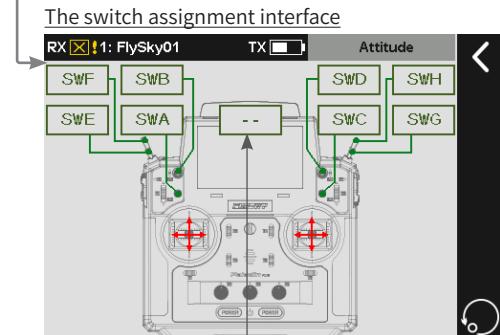

Notes:

1. The rate value indicates the output in percentage of a channel.
2. The combo switch needs to be set before other rate functions can be selected. You can switch 9 output values via this combo switch after the setting is completed.
3. Only toggle switch can be assigned.
4. This function is not available for glider model.

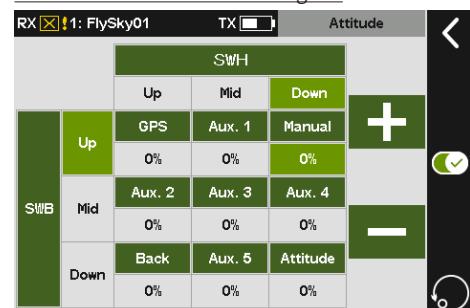

(1) / (2) Tap to enter the switch assignment interface. "--" indicates that the switch is unassigned.

(3) Tap the dark/light green area, you can set the output names of the nine channels.

Tap to cancel the assigned switch.

The interface of the switch assigned

8.22 Telemetry Control

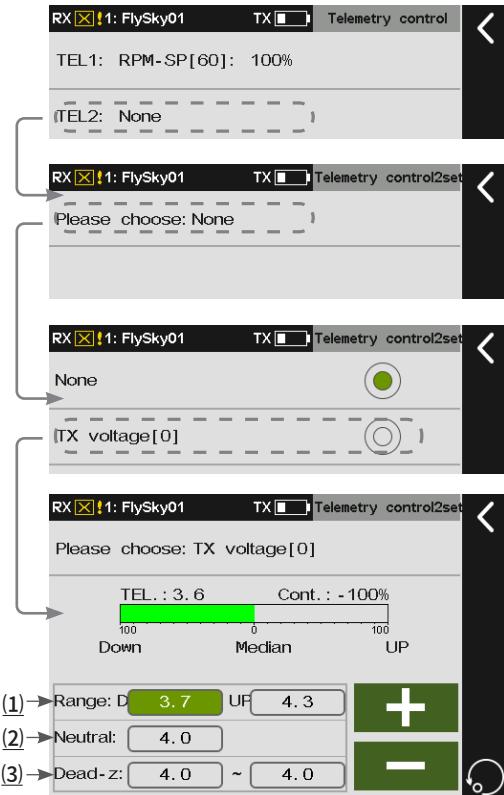

Note: This function is available for version 1.0.70 or later.

This function can convert the transfer-back data into control variable values, you can choose any 2 return values to convert into "TEL1" and "TEL2", and assign this as a control in **Function Assignment**, Switch Assignment, Mixes and other functions. For example, use the temperature sensor to enable the heat sink for cooling.

Setup:

1. Tap **Telemetry control**.
2. Tap the TEL you want to set to enter the setting interface.
3. Select an appropriate sensor, then click ↻ to return to the parameter setting interface.
4. Tap the parameter, then click + or - to set an appropriate value. Click ↻ to return.

Note: You can set the telemetry as a switch, a control or Master of a Mix to achieve a smart control via the sensor's variable data.

(1) D: The sensor data set here will be converted to the control value -100%; UP: the sensor data set here will be converted to the control value 100%.

After setting the data: D value ~ UP value corresponding to the control value -100% (min.) ~ 100% (max.).

(2) Neutral: According to the set UP and D end values, the neutral value is automatically generated, and the corresponding output control value is 0% (neutral value).

If the control area corresponding to the required data is not symmetrical, this value can be modified to set the required neutral value. The setting range will be limited to between the UP and D values.

(3) The default neutral has no Dead-zone. This item can be set if you want a small range of values fluctuating around the neutral (this will not affect the control value). Within this range, the output control value is always 0% (neutral value). The access to the Dead-zone setting is limited to both sides of the neutral and the middle of the UP and D end values.

Application Example:

Use the temperature sensor data to enable the heat sink through the telemetry function. When the temperature exceeds 30° C, the heat sink is enabled.

The preparation process is as follows: Install the temperature sensor and connect to the receiver > Install the servo

for controlling the heat sink and connect to the receiver > Connect the transmitter to the receiver.

At the transmitter side, it is necessary to use the program mixes function to achieve this. The steps are as follows:

1. Enter the **Program Mixes** interface and complete the following settings.

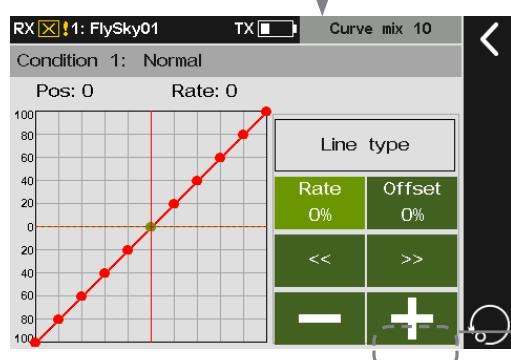

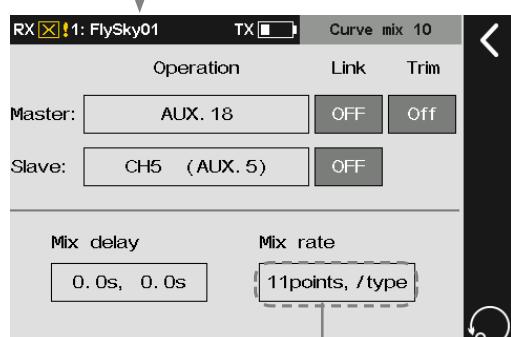

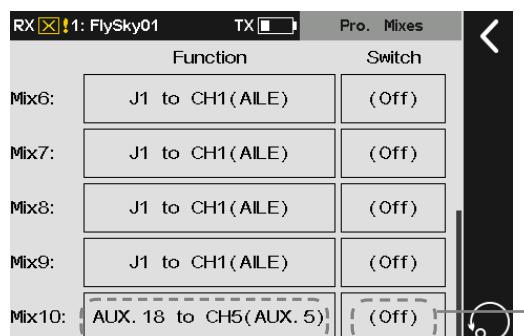

- Select an auxiliary channel as Master, for example, auxiliary channel 18.
- Set the servo channel that controls the heat sink, for example, auxiliary channel 5. Set it to Slave.
- Click **Mix rate**. Select the line type and select the point at the middle position and set its rate to the appropriate value, for example, 100%.
- Assign TEL1 as the switch to control the mix.

2. Enter the **Telemetry Control** interface.

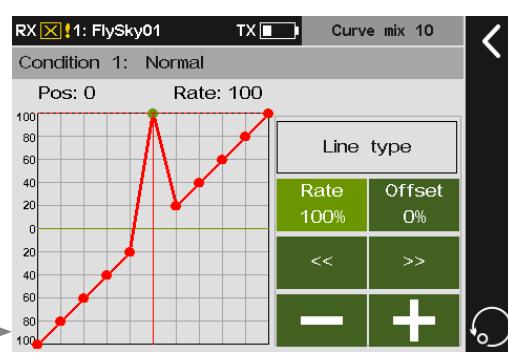

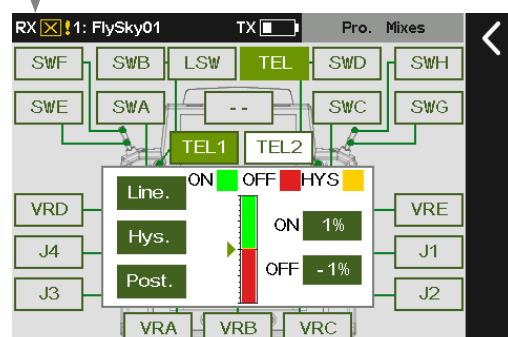

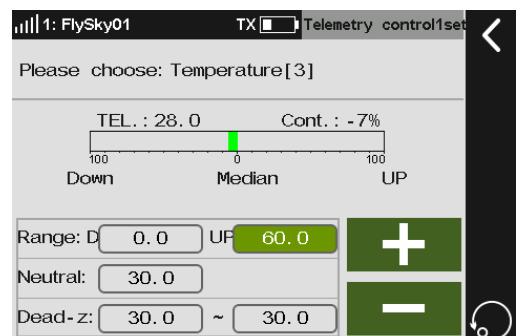

- Set TEL1 to the temperature sensor and set natural value to 30.

When the temperature exceeds 30° C, the TEL1 switch is ON and Mix 10 runs. When the temperature is lower than 30° C, the switch is OFF, the running stops, and the channel stops output.

The setting interface of Mix

The setting interface of Telemetry Control

For different models, the telemetry function needs to be set accordingly to achieve specific control effects. To achieve better control effect, the joint debugging can be performed with using the functions such as Mixes, DR, and Function Assignment (AFR).

9. Helicopter Exclusive Function Setting

This chapter introduces the function settings of Helicopter mainly in default condition. After you can set the related model parameters via **Basic > Models**, then you can access **Model** to set the related functions of model via **Home1 > Model**.

Note: the function interface may different based on different model configurations.

9.1 Display Servos

Please refer to **7.1 Display Servos** for this function.

9.2 Condition

Please refer to **8.2 Condition** for this function.

9.3 Func. Rate (AFR)

Please refer to **8.3 Func. Rate(AFR)** for this function.

9.4 DR Setup

Please refer to **8.4 DR setup** for this function.

9.5 Channel Offset

Please refer to **8.5 Channel offset** for this function.

9.6 Pro. Mixes

Please refer to **8.6 Pro. Mixes** for this function.

9.7 Servo Speed

Please refer to **8.7 Servo speed** for this function.

9.8 Throttle Curve

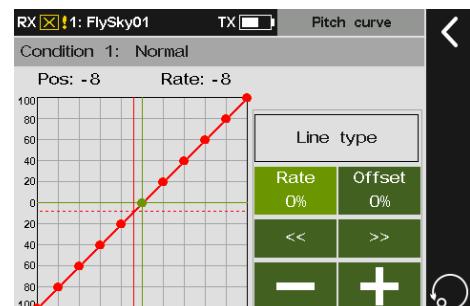

Please refer to **8.8 Throttle Curve** for this function.

9.9 Pitch Curve

In the current condition, adjust the motion curve of the helicopter's pitch to match the throttle output to achieve the best flight status. To set in another condition, you need to switch the condition first. Different output rate can be obtained through multi-point linear settings (up to 11 points).

Setup:

Note: For the setting of Rate/Offset, refer to the description in **Throttle curve** above. For the Line type, please refer to the descriptions in chapter 16.

9.10 Throttle Cut

Please refer to **8.9 Throttle Cut** for this function.

9.11 Idle Up

Please refer to **8.10 Idle Up** for this function.

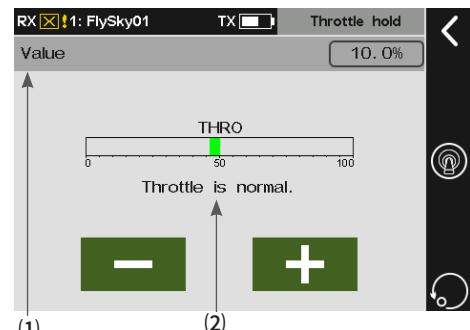

9.12 Throttle Hold

Quickly locking the throttle channel output value at a preset value by one switch can assist in spin landing, or act as a throttle lock switch to lock the throttle position in a safe place during commissioning. This function is not valid when the throttle cut switch is on. When the throttle hold is on, the mixes of the throttle from other functions is invalid. The throttle function is output after channel operations (Travel, Range, Normal and Reverse and channel delay) with the set hold values. The throttle function's mixes on other functions is also brought into operation using the value.

Setup:

1. Tap **Throttle hold** to enter the setting interface.
2. Click + or - to set an appropriate value.
3. Click  to set the switch to enable/disable the function.

Note: For settings of switch, refer to the descriptions in chapter 16.

(1) Displays the value of the throttle hold when the throttle hold function enables.

(2) "Throttle is normal!" indicates the throttle hold function is disabled and the throttle status is normal. If the throttle hold function is enabled, the prompt changes to "Throttle held!" in red.

9.13 Throttle Needle

Please refer to **8.11 Throttle Needle** for this function.

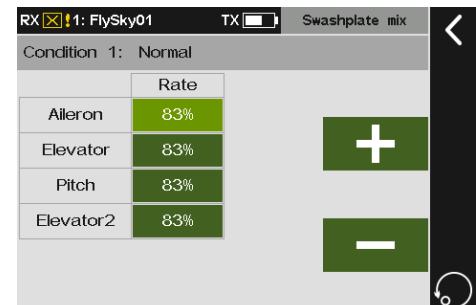

9.14 Swashplate

Note: This function is derived from the original mixes and is only available on version 1.0.65 or later.

In the current condition, correspond the helicopter's ailerons, elevation and pitch to the mixes of the servos to achieve the best flight effect.

Setup:

1. Tap **Swashplate mix** to enter the setting interface.
2. Tap item you want to set.
3. Click + or - to set the appropriate value. Click  to return to the previous interface.

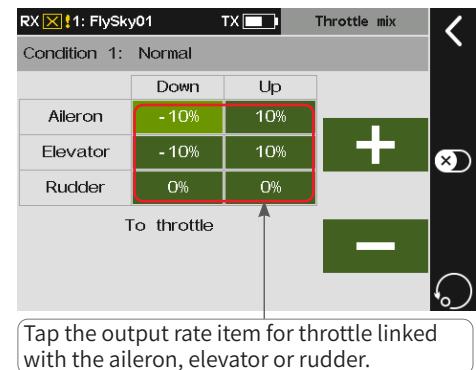

9.15 Thro Mixed

Note: This function is derived from the original mixes and is only available on version 1.0.65 or later.

In the current condition, set the helicopter's ailerons, elevation and rudder to the throttle's mixes rate. It is used to coordinate the flight movements of the helicopter in all directions (forward, backward, left and right) to compensate for the effect of swashplate manipulation on the engine when operating ailerons, elevation and rudder.

Setup:

1. Tap **Thro mixed** to enter the setting interface.
2. Tap item you want to set.
3. Click + or - to set the appropriate value. Click  to return to the previous interface.

9.16 Swashplate Ring

Limit the angle of swashplate movement. Change the helicopter's cycle pitch by adjusting the travel range of ailerons and elevation channels to control the helicopter's movements in all directions (forward, backward, left and right). If the ailerons and elevation travel range change too much, and the helicopter's swashplate angle exceeds the limit of the mechanical structure, the helicopter might be seriously damaged. Therefore, this function can protect the helicopter's mechanical structure.

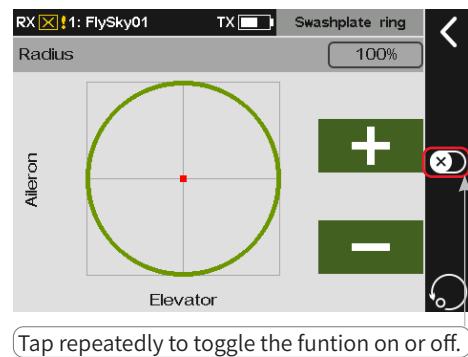

This is a swashplate related advanced function. If you protect the mechanical structure by limiting the aileron and elevation movements via maximum travel range, the swashplate movements will be greatly restrained. But this function allows users to obtain more operation room while ensuring performance of the function.

Setup:

1. Tap **Swashplate ring** to enter the setting interface.
2. Click + or - to set the appropriate value. Click ↺ to return to the previous interface.

Note: The green circle is the maximum range of the swashplate. The length of the line indicates the angle of the current swashplate. When the angle of the swashplate exceeds the radius, it will be limited to the radius value.

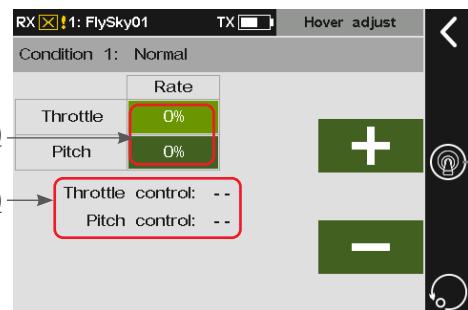

9.17 Hover Adjust

In the current condition, in order to allow the helicopter to hove easily by adjusting the rate of **Throttle** and **Pitch**. To set in another condition, you need to switch the condition first.

Setup:

1. Tap **Hover adjust** to enter the setting interface.
2. Tap the function you want to set.
3. Click + or - to set the appropriate value.
4. Click ⌂ to enter, and click **Throttle control** to enter the control assign interface. Afterwards, click a knob you want to set for throttle control or turn the physical knob on the transmitter. Then click ↺ to return to the previous interface.
5. Tap **Pitch control** to enter the control assign interface. Click a knob you want to set for throttle control or turn the physical knob on the transmitter.

Note: For the control of the function, you can only set a knob.

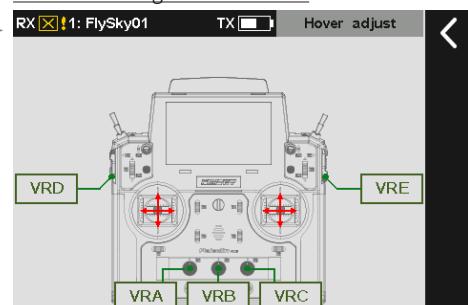

(1) Tap to select the rate item of throttle or pitch.
(2) "--" indicates the control is unassigned. After the control is assigned, the control name is displayed here.

(1) Tap to enter the interface that can assign a control to control the throttle.
(2) Tap to enter the interface that can assign a control to control the pitch.

The switch assignment interface

9.18 Gyroscope

Set the output value of gyroscope channel.

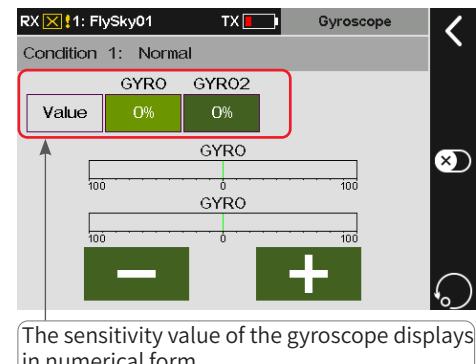

The system is preset with two gyroscope modes to switch between by a switch. You can switch between the modes to adjust the gyroscope channel output sensitivity. It is recommended to assign a two-position switch to switch between gyroscope 1 and gyroscope 2.

The function parameter setting is for the current condition. To set in another condition, you need to switch the condition first.

Setup:

1. Tap **Gyroscope** to enter.
2. Tap  to enter, then assign a switch to control this function. For example, assign **SWB** in up position to turn on **Gyroscope1**.
3. Move the **SWB** switch to the up position and use + or - to change the sensitivity value of **Gyroscope1**.
4. Move the **SWB** switch to the down position and use + or - to change the sensitivity value of **Gyroscope2**. Click  to return to the previous interface.

Note: For settings of switch, refer to the descriptions in chapter 16.

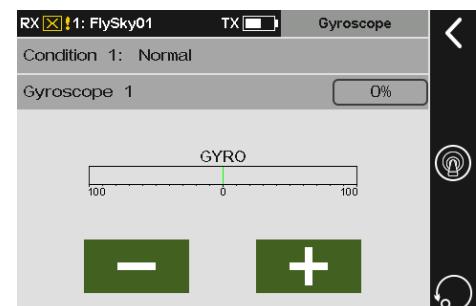

9.19 Governor

Set the output value of **Governor** channel to adjust the RPM of the helicopter propeller to make the helicopter fly more stable. The function parameter setting is for the current condition. To set in another condition, you need to switch the condition first.

Setup:

1. Tap **Governor** to enter the setting interface.
2. Click + or - to set the appropriate value. Click  to return to the previous interface.

9.20 Logic Switches

Please refer to **8.20 Logic Switches** for this function.

9.21 Telemetry Control

Please refer to **8.22 Telemetry Control** for this function.

10. Multicopter Exclusive Function Setting

This chapter introduces the function settings of Multicopter mainly in default condition. After you can set the related model parameters via **Basic > Models**, then you can access **Model** to set the related functions of model via **Home1 > Model**.

Note: the function interface may different based on different model configurations.

11.8 Throttle Curve

Please refer to **8.8 Throttle Curve** for this function.

11.9 ABS

This function can be used to set pulse braking, namely the brakes are released periodically when braking is triggered, to prevent skid, drift or under-turning due to locked wheels.

Note: This function is available for humvees model.

Tap to enter the switch assignment interface.

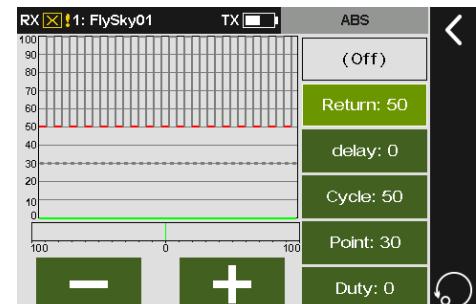

Note: For settings of switch, refer to the descriptions in chapter 16.

Return

To set the reduction of braking pressure at each pulse between 0% and 100%. The default value is 50%. When the value is set to 60%, the system will reduce the braking pressure by 60% from each pulse in real-time when braking is triggered.

Setup:

1. Tap **Return** to enter the setting interface.
 2. Click + or - to set the appropriate value.
- Click **⬅** to return to the previous interface.

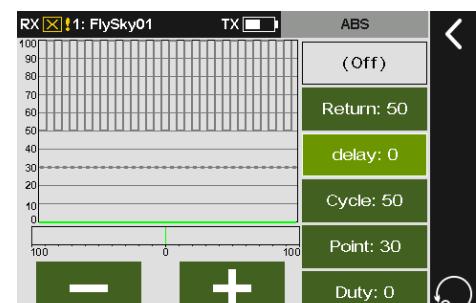

Delay

To set the time from trigger the pulse brake to actually pulse brake between 0% to 100%. The default value is 0%. The higher the value, the slower the pulse brake function will take effect. When the value is set to 0%, there is no delay, i.e. the pulse brake function takes effect immediately when the brake is triggered. When the value is set to 100%, the delay is 2S.

Setup:

1. Tap **Delay** to enter the setting interface.
 2. Click + or - to set the appropriate value.
- Click **⬅** to return to the previous interface.

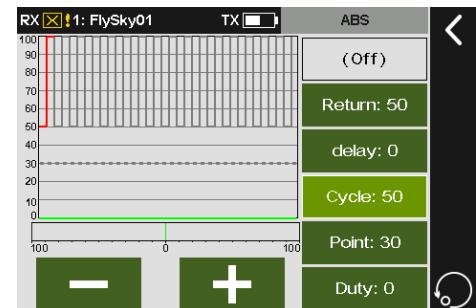

Cycle

It is used to set the interval between pulses. The setting range is 20% to 100%. The default value is 50%. The larger the value, the longer the interval time between pulses. The value 100% indicates the interval is 0.5S.

Setup:

1. Tap **Cycle** to enter the setting interface.
2. Click + or - to set the appropriate value.
Click to return to the previous interface.

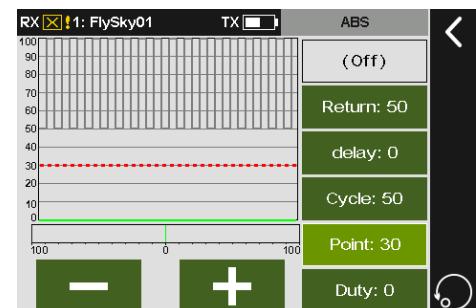

Point

It is used to set the start position of pulse brake function. The setting range is 20% to 100%. The default value is 30%. The higher the value, the closer the stick position that triggers the pulse brake function is to the full brake position. 0%-100% is the entire travel movement amount of the throttle control brake end.

Setup:

1. Tap **Cycle** to enter the setting interface.
2. Click + or - to set the appropriate value.
Click to return to the previous interface.

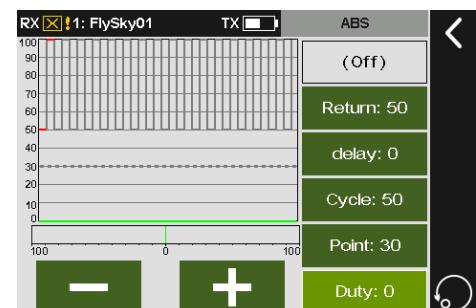

Duty

To set the braking - release cycle length in pulse braking between -4 and +4. Default: 0. When the value is changed, the peak and trough lengths of the brake pulse's square wave change accordingly. You can adjust the ratio between braking and release. The rate is 1:1 when the cycle length is set to "0". The rate is 1:2 when the cycle length is set to "1". And the rate is 2:1 when the cycle length is set to "-1".

Setup:

1. Tap **Cycle** to enter the setting interface.
2. Click + or - to set the appropriate value.
Click to return to the previous interface.

11.10 Track Mixing

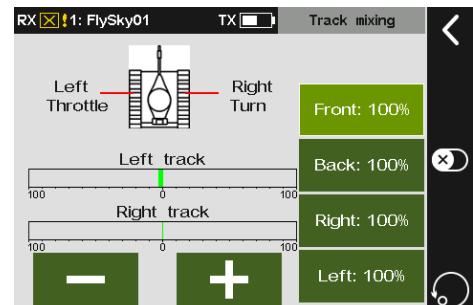

Note: This function is available for version 1.0.65 or later.

When this function is enabled, the control corresponding to the left track can control the changes of the left and right tracks in same rate to move forward and backward, and the control corresponding to the right track can control the changes of the left and right tracks in reverse-rate to turn left and right. The forward, backward, left and right rates can be set in the function menu.

Note: This function is available for track model.

Setup:

1. Tap Delay to enter the setting interface.
2. Tap the function item you want to set.
The currently selected function item is highlighted in light green.
3. Click + or - to set an appropriate value. Tap  to return to the previous interface.

11.11 Logic Switches

Please refer to **8.20 Logic Switches** for this function.

11.12 Telemetry Control

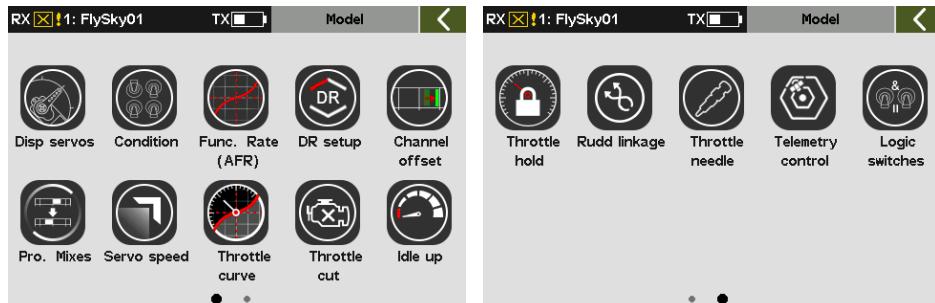

Please refer to **8.22 Telemetry Control** for this function.

12. Boat Exclusive Function Setting

Note: This function is available for version 1.0.65 or later.

This chapter introduces the function settings of **Boat** mainly in default condition. After you can set the related model parameters via **Basic > Models**, then you can access **Model** to set the related functions of model via **Home1 > Model**.

12.9 Logic Switches

Please refer to **8.20 Logic Switches** for this function.

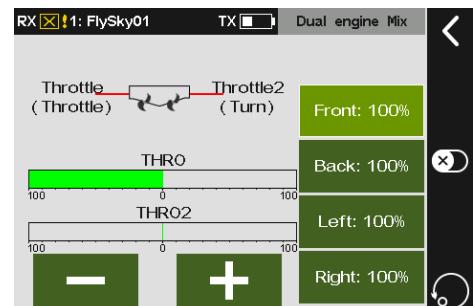

12.10 Dual Engine Mix

Note: This function is available for version 1.0.70 or later.

This function enables when the ship model has dual engines without rudders. By dual engine mix function to control the forward/backward or left/right of the ship.

Setup:

1. Tap Dual enigne Mix.
2. Tap the function item you want to set. The currently selected function item is highlighted in light green.
3. Click + or - to set an appropriate value.
4. Tap to enable the function, then click to return to the previous interface.

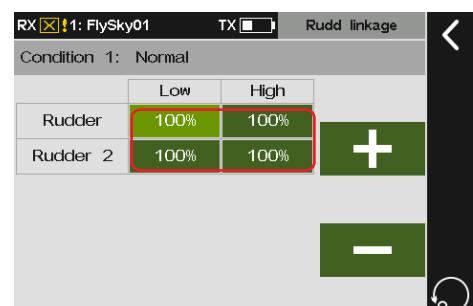

12.11 Rudd Linkage

Note: This function is available for version 1.0.70 or later.

This function enables when the ship model has dual engines with two rudders to realize the rudder linkage output. The function parameter setting is for the current condition. To set in another condition, you need to switch the condition first.

Setup:

1. Tap Rudd Linkage.
2. Tap the function item you want to set. The currently selected function item is highlighted in light green.
3. Click + or - to set an appropriate value.
4. Tap to enable the function, then click to return to the previous interface.

12.12 Telemetry Control

Please refer to **8.22 Telemetry Control** for this function.

12.13 Throttle Hold

Please refer to **9.13 Throttle Hold** for this function.

12.14 Throttle Needle

Please refer to **8.11 Throttle Needle** for this function.

12.15 Throttle Curve

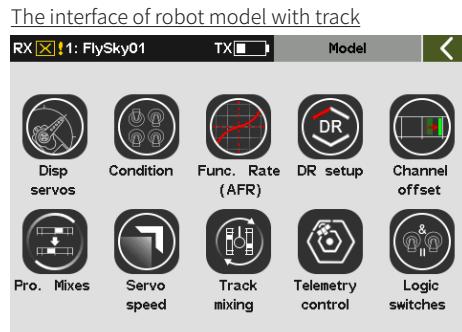

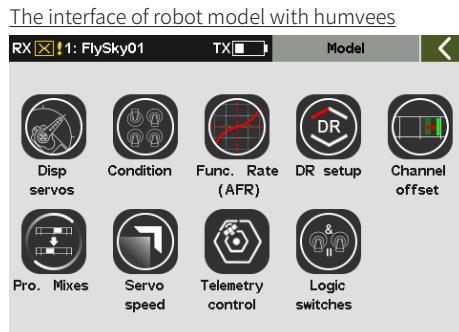

Please refer to **8.8 Throttle Curve** for this function.

13. Robot Exclusive Function Setting

Note: This function is available for version 1.0.65 or later.

This chapter introduces the function settings of **Robot** mainly in default condition. After you can set the related model parameters via **Basic > Models**, then you can access **Model** to set the related functions of model via **Home1 > Model**.

13.1 Display Servos

Please refer to **7.1 Display Servos** for this function.

13.2 Condition

Please refer to **8.2 Condition** for this function.

13.3 Func. Rate (AFR)

Please refer to **8.3 Func. Rate(AFR)** for this function.

13.4 DR Setup

Please refer to **8.4 DR Setup** for this function.

13.5 Channel Offset

Please refer to **8.5 Channel Offset** for this function.

13.6 Pro. Mixes

Please refer to **8.6 Pro. Mixes** for this function.

13.7 Servo Speed

Please refer to **8.7 Servo Speed** for this function.

13.8 Telemetry Control

Please refer to **8.22 Telemetry Control** for this function.

13.9 Track Mixing

Please refer to **11.10 Track Mixing** for this function.

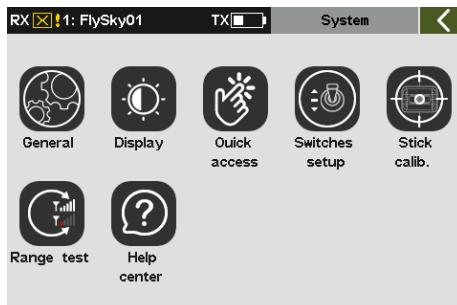

13.10 Logic Switches

Please refer to **8.20 Logic Switches** for this function.

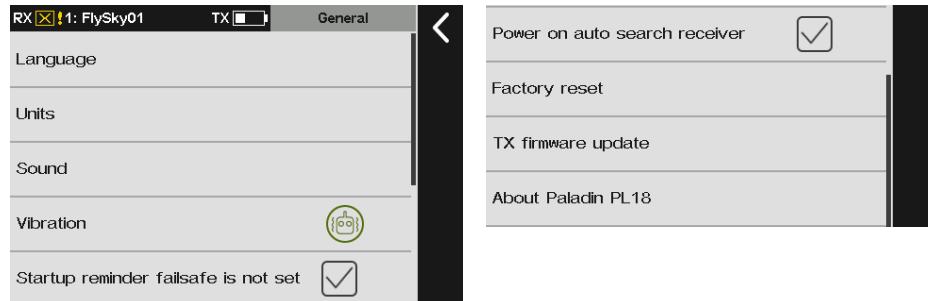

14. System Setting

The system menu content is mainly used to set various system functions of the transmitter, such as screen settings, sound settings, and so on. Access System functions via Home1 > System.

14.1 General Function Setting

This section describes the setting on the General function. To access the General function via Home1 > System > General.

14.1.1 Language Setting

You can choose the language from English and Chinese.

Setup:

1. Tap Language to enter.
2. Tap an appropriate language. Then click back arrow to return.

14.1.2 Units

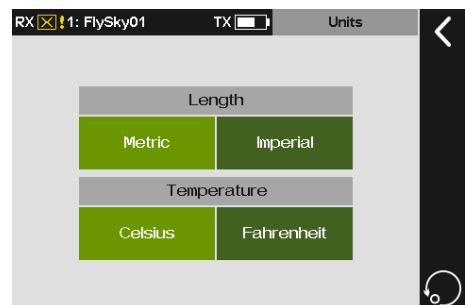

Choose what units to use for length and temperature.

Length can select metric and imperial system. The default is Metric.

Temperature can be selected in Celsius and Fahrenheit. The default is Celsius.

Setup:

Tap Units to enter and click an appropriate item. Then click back arrow to return.

微信公众号

Bilibili

Website

Facebook

14.1.3 Sound

Turn on or off system sound, alarm sound, or ON/OFF sound.

Setup:

1. Tap **Sound** to enter.
2. Tap an appropriate item you want to set. "√" appears and indicates to turn on the sound.
3. Click +/- to change the volume of the sound. Then click  to return.

14.1.4 Vibration

This function is used to set whether the vibration is enabled or disabled, and the vibration level when turned on.

Setup:

1. Tap **Vibration** to enter.
2. Tap an appropriate item you want to set. Then click  to return.

Note: On the General interface, it will display the set vibration status, namely whether vibration is enabled or not and the vibration level when enabled.

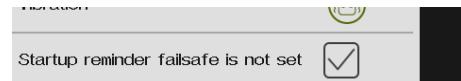

14.1.5 Startup Reminder Failsafe is Not Set

Note: This function has been added in version 1.0.73 and later.

Set to check or uncheck the Startup reminder failsafe is not set.

Setup:

Tap the box next to right of the function, when it is not ticked (√), it indicates that the function is disabled.

Note: Turn off the function, and the "Startup reminder model is not set" function is unchecked and all channels are not in Not Set (No Output) status, then a pop-up window will not prompt that failsafe has not been set when the transmitter is turned on.

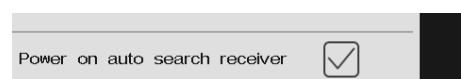

14.1.6 Auto Search For Receiver

Note: This function is applicable for version 1.0.65 or later.

When the **Power on auto search receiver** is checked and the RF is turned on. You can make settings to automatically switch to the model corresponding to the currently powered on receiver. It is same as the **Searching for the receiver** function of **Model Select**.

Setup:

Tap **Power on auto search receiver**, "√" appears and indicates to turn on it.

14.1.7 Factory Reset

Resets the transmitter to its factory default state. All data including all model data and system settings will be reset.

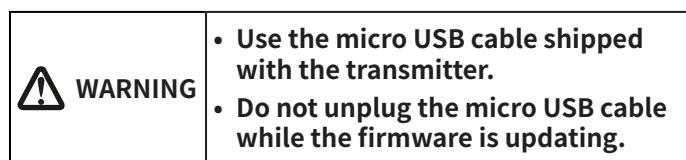

Setup:

Tap **Factory reset** and click **Yes** on the pop-up screen. Then the transmitter will reset to its factory default mode.

14.1.8 Updating Transmitter Firmware

Updates the transmitters firmware. In case of updating the firmware of the transmitter, use this function to put the transmitter to enter updating mode first, then upgrade the transmitter's firmware.

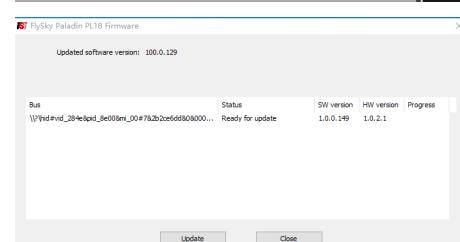

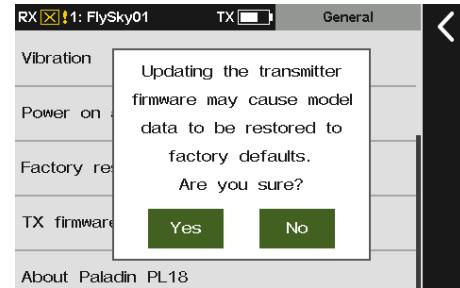

Setup:

1. Download the latest firmware, then open it.
2. Connect the PC and PL18 transmitter via micro USB cable.
3. Tap **TX firmware update** via **System > General**, a pop-up screen appears. Click **Yes** to put the transmitter into updating mode.
4. The updating interface in the PC is shown on the right, for your reference only. Click **Update** to start.
5. The transmitter will power on again when the updating process is completed. Then remove the USB cable and close the firmware.

Notes:

1. The firmware of the transmitter can also be updated by FlyskyAssistant. In such case, make sure the transmitter is connected to the PC only.
2. If more than one firmware are opened at the same time, only one software can recognize the transmitter.

14.1.9 About Paladin PL18

To view system information, including product name, software version, software release date, and hardware version.

Setup:

Tap **About Paladin PL18** to view.

微信公众号

Bilibili

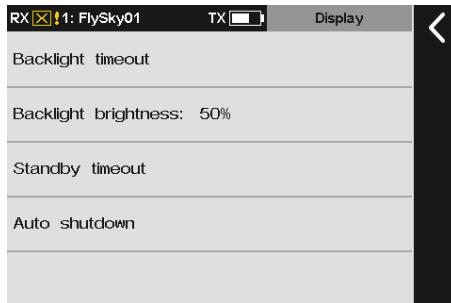

Website

Facebook

14.2 Display Setting

This section describes the setting on the Display function. To access the Display function via Home1 > System > Display.

14.2.1 Backlight Timeout

Changes how long the screen takes to turn off when not in use. The default is 30 seconds. You can set an appropriate time as your desired.

Setup:

1. Tap Backlight timeout to enter.
2. Tap an appropriate item you want to set. Then click to return.

Note: Leaving the screen on for longer will use more power and as such may lead to reduced battery time.

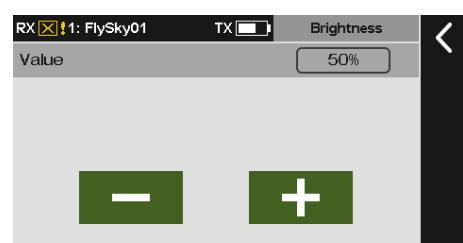

14.2.2 Backlight Brightness

Adjusts the brightness of the screens backlight.

Setup:

1. Tap Backlight brightness to enter.
2. Click +/- to change to an appropriate value. Then click to return.

Note: Turning the brightness up will use more power and as such will lead to reduced battery life.

14.2.3 Standby Timeout

Sets the time of the Standby timeout.

Setup:

1. Tap Standby timeout to enter.
2. Tap an appropriate item you want to set. If you do not want to set it, click None. Then click to return.

14.2.4 Autoshut Down

To enable/disable the function which turns the transmitter off if not connected to a receiver and is not in use.

Setup:

1. Tap Auto shutdown to enter.
2. Tap an appropriate item you want to set. If you do not want to set it, click **None**. Then click to return.

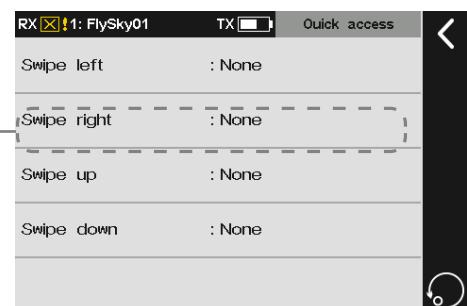

14.3 Quick Access Setting

This function is used to set up the up, down, left and right quick sliding screen functions of the main interface. Users can customize the sliding screen interface according to their needs. The default setting is **None**.

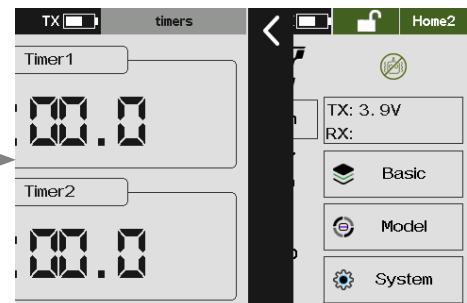

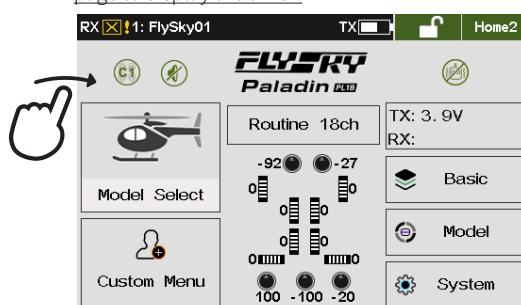

Setup:

1. Tap Quick access and click the item you want to set to enter the next interface.
2. Tap an appropriate item you want to set. Then click to return.

Note: When you slide the main interface, please slide from the area as close to the borders of the main interface as possible. For example, slide from the right slide of the main interface in the figure.

After setting, interface for sliding right on the home page to display the timer:

Website

Facebook

14.4 Position-switch Setup

This function is used to set up whether it will be a two-position switch or a three-position switch for SWE, SWF, SWG and SWH. If you want to replace the switch in these four switches.

Setup:

1. Tap **Switches setup** to enter.
2. Tap the switch you want to set repeatedly to toggle between **3 levels** or **2 levels**. Then click  to return.

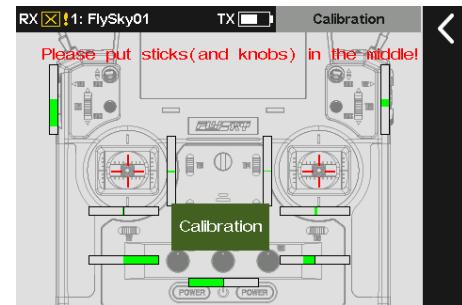

14.5 Stick Calibration

Used to calibrate the sticks(J1-J4) and the knobs(VRA-VRE).

Setup:

1. Tap **Stick Calib.** to enter the calibration interface. Place the sticks and knobs marked on the interface in the central position.
2. After you click **Calibrate**, the system will pop up "Please move the sticks and knobs to the maximum and minimum travel".
3. Push all the sticks J1-J4 along the direction of left/right/forward/backward to the maximum or minimum travel.
4. Turn all knobs VRA-VRE in the direction of clockwise/counterclockwise to maximum or minimum travel.
5. After turning the sticks and the knobs to the maximum and minimum travel respectively, click  to return.
 - If the "Calibration succeeds" pop-up screen appears, click **Exit**.
 - If the calibration fails, tap **Yes** to recalibrate. To exit the calibration interface automatically, tap **No**.

14.6 Range Test

Used to test whether wireless communication between the transmitter and the receiver is normal and the ambient radio interference.

As the actual remote control distance between transmitter and receiver is far away, it is difficult to make the transmitter and receiver apart to several hundred meters to verify whether the RF module works normally. By using this function, the theoretical remote control distance can be reduced to 30-40 meters. When this function is enabled, it can test whether the transmitter and receiver are normal in a close distance, so as to save the test time.

Note: This function is only applicable to RF FRM301.

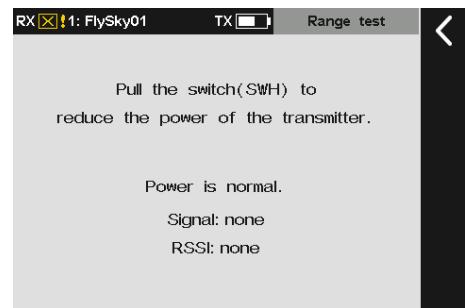

Setup:

1. Make sure the transmitter and the receiver are bound normally.
2. Enter the **Range Test** interface and pull down the **SWH** button
3. One person stands in place with the model in hand,

and the other person holds the transmitter and gradually moves away to 30-40 meters and walks around with this distance as a radius centered on this model.

4. Make sure that the transmitter antenna is not blocked. The receiver antenna is placed at 90 degrees, and there is no interference between the transmitter and the receiver in the open area.
5. Observe the signal strength of the transmitter. If the signal strength is high and stable, it means that the radio frequency of this system works normally.

14.7 Help Center

Note: This function is applicable for version 1.0.65 or later.

To obtain the user manual via this function. Users can contact us through social accounts listed on the interface.

Setup:

1. Tap **Help center** to enter.
2. Tap the item you want to view, then the corresponding QR code will be displayed.
3. Scan the QR code to obtain the related information. Then click to return to the previous interface.

Website

Facebook

15. Custom Menu Setting

This function allows you to customize the menu item sorting and hiding in the menu area. You can prioritize to list some frequently used function compared to those seldom used function, and hide some less used function items. By default, all function items are visible.

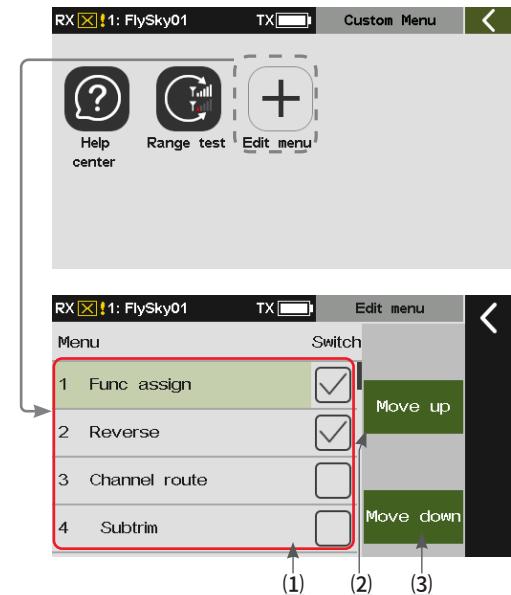

Setup:

1. Tap Edit menu.
2. Tap the item you want to move, namely the item in highlight color is selected. Click Move up or Move down to change its order in the list.

Note: There is a function box on the right. If you select the checkbox, it means that the function item is displayed. If you do not select it, it means that the function item is hidden.

For example, move Func. assign to the second position:

1. Tap Edit menu.
2. Click Func. assign.
3. Click Move down once to finish.

- (1) Function items area, tap it, "√" appears and it means that the function is displayed. "√" does not appear, it means that the function is hidden.
- (2) Tap to move the selected item up.
- (3) Tap to move the selected item down.

16. Same Common Operation Items Setting

This section describes the setting steps for some common operation items in the function settings.

16.1 Switch assignment

Note: This function is applicable for version 1.0.65 or later.

How to set a switch which is for certain functions.

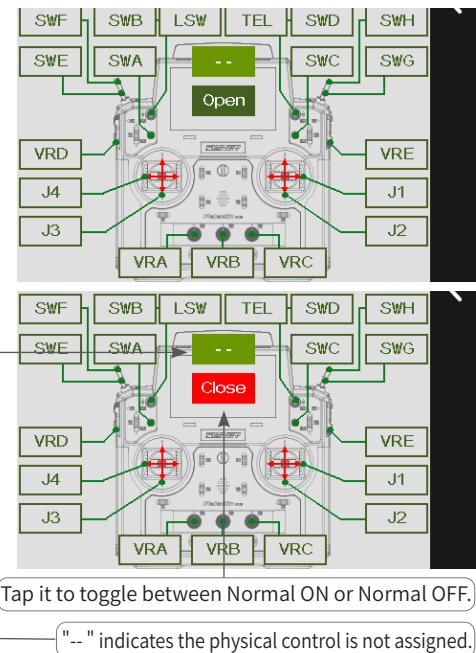

16.1.1 Normal ON/OFF Switch Setting

If the function does not need switch control, it can be set to "--" with the state being set to **Open** or **Close**. At this time, the function is disabled or enabled. In the execution of the trainer function, the switching state of the student remote control can be set through this function.

Setup:

1. Enter the switch assignment interface.
2. Click **Open** to toggle between **Open** or **Close**.
3. Click -- to cancel the switch if a physical control on the transmitter is assigned.

Note: Action switch does not support the setting of Normal ON or Normal OFF. On such switch assignment interface, you can tap -- to only disable the switch assignment function, for example, clear polarity of sensor, enable/disable timer switch, and so on.

16.1.2 Position-switch Setting

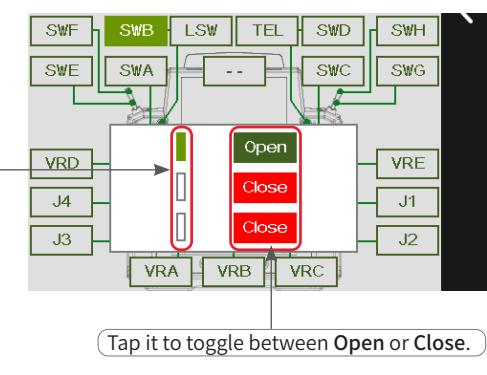

For two-position and three-position switches, you can set any position to **Open** or **Close**.

Setup:

1. Enter the switch assignment interface.
2. Toggle the corresponding physical control on the transmitter or tap the control name in the interface to select the control, for example, SWD.
3. Tap **Open** or **Close** of any gear position to set the appropriate on or off status of this position.

Notes:

1. Except for **SWH**, all switches starting with "SW" are for position switches. **SWH** is a spring return switch. It is recommended to set other position switches as the ON or OFF switch for functions.
2. The switch assignment operations for the Timer and Sensor are the same as above. However, this switch function is "Action Switch". That is, the action switching from "OFF" position to "ON" position is a valid action, and this function is a one-time switch.

微信公众号

Bilibili

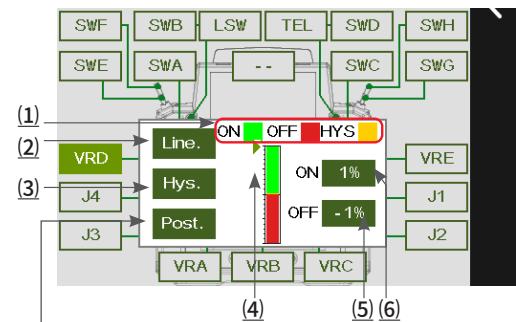

Website

Facebook

16.1.3 Continuous Switch Setting

For continuous controls such as stick or knob, the **ON** or **OFF** position can be set more flexibly according to different setting types.

Tap to switch between Post.(Positive) and Neg.(Negative).

(1) To display the switch state in this area. The green means **ON**, the red means **OFF**, the yellow means **HYS**(hysteretic).

(2) Tap repeatedly to toggle between Line.(linear) and Symm.(symmetric).

(3) Tap repeatedly to toggle between Hys.(Hysteresis) and Box.

(4) Triangle means the present position of the control.

(5) To show the position value of **OFF**. Tap to set the present position of the control to **OFF**.

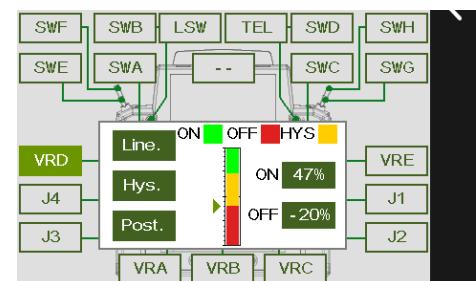

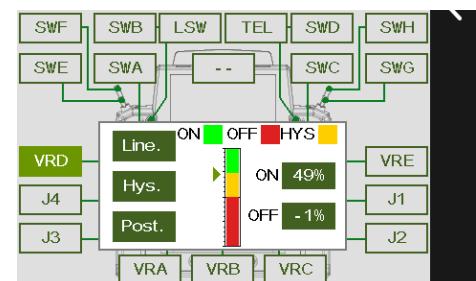

(6) To show the position value of **ON**. Tap to set the present position of the control to **ON**.

Linear/Symmetric Mode

Line. means the setting of **ON** or **OFF** position separately for the whole control travel. Symmetric means the setting of **ON** or **OFF** position symmetrically for the upper part or the lower part with the neutral point as the reference. You can switch the **ON** or **OFF** position by **Posit.** (Positive) or **Reve.** (Reverse).

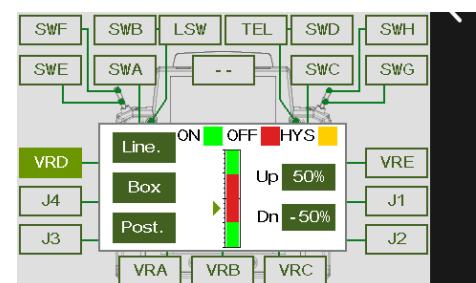

Setup:

1. Enter the switch assignment interface.
2. Toggle the corresponding physical control on the transmitter or tap the control name in the interface to select the control, e.g., VRD.
3. Switch the type mode by tapping Line.
4. Turn the VRD to a suitable position, and click **ON** in the green function box on the right to set this position to **ON**.
5. Turn the VRD to another suitable position, and click **OFF** in the green function box on the right to set this position to **OFF**.
6. Click **Posit.** to reverse the switch status.

Hysteresis/Box Mode

Hys. means the setting of border for **ON** or **OFF** only. You can set the hysteresis interval yellow for the border. When the control position is in the hysteresis interval, the previous state is kept. Box has no hysteresis interval. You can set 2 border values for on/off area. When the switch is outside this area, the switch state is opposite to the state inside this area. You can switch the **ON** or **OFF** position by **Posit.** or **Reve.**

Setup:

1. Enter the switch assignment interface.
2. Tap the control name in the interface to select the switch, for example, VRD.
3. Switch the type mode by tapping 'HYS.'
4. Turn the VRD to a suitable position, and tap the green function box to the right of "ON" to set this position to ON.
5. Turn the VRD to another suitable position, and tap the green function box to the right of "OFF" to set this position to OFF.
6. Click 'Posit.' to reverse the switch status.

Note: If the mode is set to 'Box', the interface will display 'Up'/'DW'. The area between 'Up' and 'DW' is in the off state, while all other areas are in the on state."

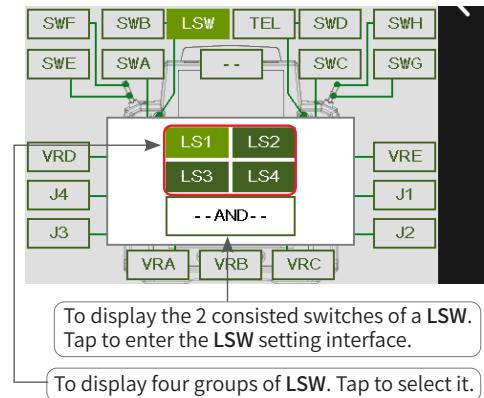

16.1.4 Logic Switch

Provide the interface for selecting logic switches. Users can preview the corresponding component switches and logical relations of logic switches, and can click the preview box to enter the logical switch setting interface to reset the logical switches.

Setup:

1. Enter the switch assignment interface.
2. Click LSW and a pop-up screen appears. Click the logic switch you want to set, then tap the area to enter the setting interface. Then you can set a new logic switch.

Note: The on/off of Logic switch is to enable or disable a function.

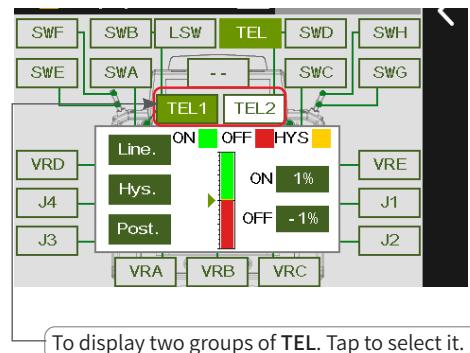

16.1.5 Telemetry Switch

Provide the interface for selecting logic switches. Users can preview the value of the telemetry switch.

Setup:

1. Enter the switch assignment interface.
2. Click TEL and a pop-up screen appears. Click the telemetry switch you want to set.

微信公众号

Bilibili

Facebook

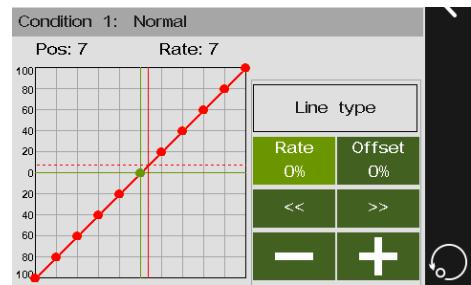

16.2 Linear Setting

Note: This function is applicable for version 1.0.65 or later.

Describe the linear settings of throttle curve and each mixes function. Such as **linear type** or **curve type** setting (**Throttle cut**, **Pitch curve**, **Throttle needle** and **Pro. mixes**).

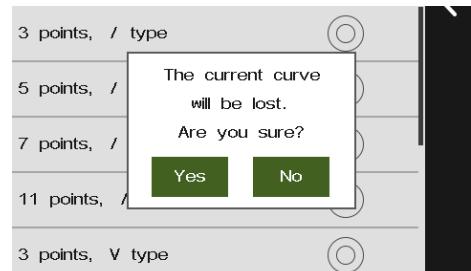

Setup:

1. Click **Linear type** to enter the setting interface.
2. Click the appropriate linear type and points. Then click **<>** to return.
 - Click **<< / >>** to select the point. The current selected point is shown in green.
 - Click **+/-** to change the values of **Rate** and **Offset**.

Notes:

1. After the linear type changes, the linear parameters before the change are overwritten.
2. The line can be shifted along the Y axis by offset value set.

17. How Transmitter Output Functions Are Processed

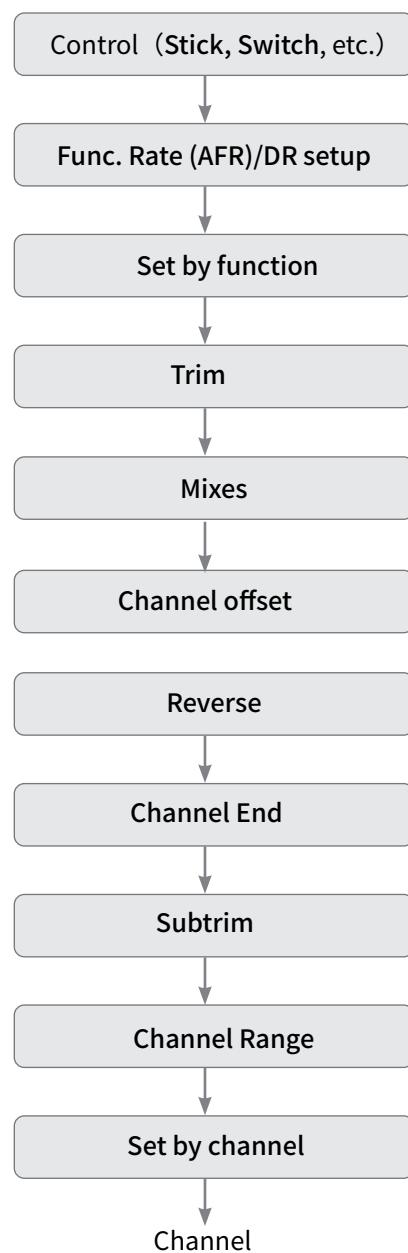

This section contains the Paladin PL18 functional arithmetic logic content.

This figure shows how the system handles the transmitter output function and how the various configuration choices/settings affect the output function.

When you move a transmitter control, such as a stick or switch, the final output value of the channel will be calculated and output in the order shown according to the setup function: **Func. Rate (AFR)/DR setup > Set by function > Trim > Mixes > Channel offset > Reverse > Channel End > Subtrim > Channel Range > Set by channel**.

Notes:

1. The Mixes includes the function mixing such as **Aileron to Rudder** and **Programming mixes**. The operation result will be output via **Reverse**, **Channel End** which is superimposed with other operation results of the channel with the **Channel Range** operation, and **Set by channel** function operation.
2. When **Master of Programming mixes** is set to a function, **Slave** will be delayed if **Set by Function** is set for this function.
3. After the value of the trim control is calculated by **Trim Rate** and **Trim Mode**, then will be superimposed with other values of this channel, such as **Subtrim**, before **Channel Range** calculation.

18. Product Specifications

This section describes the specifications for Paladin PL18 transmitter.

Product Model	PL18
Product Name	Paladin
Number of Channels	18
Compatible RC Models	Airplanes, helicopters, gliders, multicopters, cars, boats and robots.
RF	2.4GHz ISM
Maximum Power	< 20 dBm (e.i.r.p.) (EU)
RF Protocol	AFHDS 3
Distance	More than 3500m (air distance without interference)
Resolution	4096
Input Power	1S (3.7V) * 4300mAh (Built-in)
Charging Jack	Micro USB/Wireless Charging
Charging Time	4h@5V*2A/7h@5V*2A(Wireless charging)
Battery Life	More than 8 hours
Low Voltage Alarm	Lower than 3.65V
Antenna	Two bulit-in antennas
Display	HVGA 3.5 TFT
Language	Chinese, English
Simulator	USB simulator
Data Connector	Micro USB, BLUETOOTH, PHJACK(PPM)
Temperature Range	-10°C ~ +60°C
Humidity Range	20% ~ 95%
Online Update	Yes
Color	Black
Dimensions	214*86.5*192 mm
Weight	946g
Certifications	CE, FCC ID:N4ZFT1800, RCM

19. Package Contents

The chapter contains the information related to package. Please contact the local dealer for detailed configuration due to different version of transmitter.

Number	Name	Quantity
1	PL18 Transmitter	1
2	Quick Start Guide	1
3	FTr8B Receiver	1
4	Sunshade	1
5	Large Thickening Grip	1
6	Stick	2
7	Micro USB cable	1
8	Switch Sets	2
9	Soft spring for adjusting tension of gimbal assembly	4
10	Hard spring for adjusting tension force of gimbal assembly	4
11	Publicity Design Stickers	1
12	LOGO Stickers	1

20. Certifications

20.1 DoC

Hereby, [ShenZhen FLYSKY Technology Co., Ltd.] declares that the Radio Equipment [Paladin(PL18), FT18] is in compliance with RED 2014/53/EU.

The full text of the EU DoC is available at the following internet address: www.flyskyttech.com/info_detail/10.html

20.2 CE Warning

The ce warns that the installation of the antenna used in this transmitter must be kept in distance from all the personnel and shall not be used or used with any other transmitter. The end user and the installer must provide antenna installation instructions and transmitter operating conditions to meet the requirements for rf exposure compliance.

20.3 FCC Statement

This equipment has been tested and found to comply with the limits for a Class B digital device pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

To assure continued compliance, any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment. (Example use only shielded interface cables when connecting to computer or peripheral devices).

This equipment complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference.
- (2) This device must accept any interference received, including interference that may cause undesired operation.

Caution!

The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment. Such modifications could void the user authority to operate the equipment.

1. Move all your channels to the desired position.
2. Select [All channels] and then [Yes] in the confirmation box.

20.4 Environmentally Friendly Disposal

Old electrical appliances must not be disposed of together with the residual waste, but have to be disposed of separately. The disposal at the communal collecting point via private persons is for free. The owner of old appliances is responsible to bring the appliances to these collecting points or to similar collection points. With this little personal effort, you contribute to recycle valuable raw materials and the treatment of toxic substances.

CAUTION: RISK OF EXPLOSION IF BATTERY IS REPLACED BY AN INCORRECT TYPE. DISPOSE OF USED BATTERIES ACCORDING TO THE INSTRUCTIONS.

CAUTION

- replacement of a battery with an incorrect type that can defeat a safeguard (for example, in the case of some lithium battery types);
- disposal of a battery into fire or a hot oven, or mechanically crushing or cutting of a battery, that can result in an explosion;
- leaving a battery in an extremely high temperature surrounding environment that can result in an explosion or the leakage of flammable liquid or gas; and
- a battery subjected to extremely low air pressure that may result in an explosion or the leakage of flammable liquid or gas.

20.5 RF Exposure Statement

The device has been evaluated to meet general RF exposure requirement. The device can be used in portable exposure condition without restriction.

Figures and illustrations in this manual are provided for reference only and may differ from actual product appearance. Product design and specifications may be changed without notice.
